In Scotland the system of registration is carried on large and uniform lines, the machinery introduced, for the valuation of land, by the Valuation Act (17 and 18 Vict. chap. 91). The valuation roll, annually made up under the Valuation Act, is the basis of the register of voters; a new form of this valuation roll was provided in the Registration Act of 1855, each dwelling-house in the county or burgh being now specified in the roll. The duties of assessor for registration purposes are performed by the valuation assessor of each burgh, or county, or division of a county; he may not be a sheriff, sheriff-depute, collector of poor-rates, or employed factor or land agent in the county or burgh for which he is assessor. Every year, on or before the 15th of September, the assessor makes out a list of voters, arranged alphabetically according to wards or parishes and polling districts, and publishes the same. The list is to be deposited at the office of the sheriff, or other conspicuous place. Any person whose name is on the list may object to any other person as not having been entitled, on the last day of July preceding, to have his name inserted, by giving notice in a form prescribed, or on or before 21st September in case of any objection to the person so objected to; similarly, any person whose name has been omitted may claim to have it inserted,
REGNAULT

REGIUM DONUM

REGNAULT

by notice to the assessor. Between 25th September and 16th October sheriffs hold open registration courts for the purpose of revising the lists of voters and disposing of claims and objections. The revised list is delivered by the sheriff to the town-clerk or the sheriff-clerk, and, being printed, constitutes the register of voters.

His appeals were Le Drotiat (1697), Le Retour Imprém (1700), Les Folies Amoureuses (1704), Les Mémoires (1705), and his masterpiece, Le Sénateur Unhappy (1758), three years before his death, and so suddenly as to originate various contradictory reports, 4th September 1709.

Regnau was an indolent poet, but he was a master of dramatic situation and of comic dialogue, if not of versiunlity or reality. To this day the reader endorses Redc'l's complaint, as some one charged Regnau with mediocrity—'Il n'est pas médiocrément rai.' 'Qui ne se plait point à Regnau,' said Voltaire, 'n'est pas digne d'aimer Molière.'

There are editions by Didot (1820), Michiels (1854), and Fournier (1875). See the study by Mahrenholz (Oppeln, 1887), and Bibliographie by Marchéville (1857).

Regnauux, Alexandre Georges Henri, painter, was born in Paris, 30th October 1843, the son of Henri Victor Regnauux (q.v.). His aptitude for drawing manifested itself very early, and he was continually sketching the animals in the Jardin des Plantes. After an excellent education in the Lycée Napoleon, he left for England in 1850, and studied art under Lanotohe and Cabanel; and, after two unsuccessful attempts, gained the prix de Rome in 1866. Reaching Rome early in the following year, he executed there a remarkable portrait of Madame Dumas, an historical subject of 'Auteomedon breaking the Horse of Achilles,' and drew on wood illustrations for Way's Rome. He next passed to Spain with his friend Clarin; and here, as afterwards in Tangiers, he found subjects of that wildly picturesque character which best suited his genius. In 1870, he painted his powerful equestrian portrait of General Prim, now in the Louvre, and his 'Judith,' and in 1870 contributed his 'Salome' to the Salon. In 1870 was also painted, at Tangiers, his terrible picture, 'The Execution without Judgment under the Moorish Kings of Granada'—a work now in the Louvre. In the same year he returned to Paris on the outbreak of the Franco-Prussian war; and, though, as a prix de Rome, he was exempt from military service, he volunteered as a private soldier, and on the 19th January 1871 his slain brother was buried in the field of Battle, near Bouvron, in the same year. As an artist he had by no means fully expressed himself; but he had produced much that was marked by great energy and power, that caught in a peculiarly vivid way the splendid and barbaric life of the East—a life, in the words of the painter himself, 'at once rich and great, terrible and voluptuous.' A monument to Regnauux, sculptured by Henri Chapu, has been erected in the Ecole des Beaux Arts, Paris.

See the Lives, in French, by Cazalis (1872) and Marx (1887), and his Correspondence, ed. by Duprace (1873).

Regnauux, Henri Victor, chemist and physicist, was born at Aix, 24th July 1810. A shopman in a Paris bazaar, he made such good use of his scanty leisure as to qualify himself for admission in 1830 to the Ecole Polytechnique, and, after the two years' course, came out as a mining engineer. He became a professor in Lyons, and, later, was made a member of the Academy of Sciences, in consequence of some important discoveries in organic chemistry. Having filled chairs in the Ecole Polytechnique and the College de France, he became in 1854 director of the imperial porcelain-making factory of Sèvres. He devoted himself to the determination of important physical data, such as the laws of expansion of gases, the measure-

Reginnaux, Jean Francois, French comic dramatist, was born at Paris in 1855. A rich shopkeeper's son, he found himself at twenty master of a considerable fortune, and at once set out on his travels. In Italy he gave himself up to gambling, but, strange to say, increased rather than diminished his means. In his autobiographical romance, La Promenade, we read, but somewhat dubiously, of the passion of himself as Zelme for a young Portuguese wife (Elvire), his voyage back to France with her and her husband, their capture and sale as slaves by Algerian pirates, how he made himself pleasing to his master by skill in cookery, was captured himself but not so much as his mistress, was ransomed, together with the lady, for 12,000 crowns. He was next about to marry when the husband reappeared, and sent the lover off again on aimless wanderings through Holland, Denmark, Sweden, Germany, Russia, Poland, Turkey, Hungary, and Germany. From his return to Paris (1858) he gave himself to letters, and found his true vocation in the success of Le Divorce at the Théâtre Italian in 1868. Eight years later his fine comedy, Le Junior, achieved success at the Théâtre Français. Its successors were Le Drotiat (1697), Le Retour Imprévu (1700), Les Folies Amoureuses (1704), Les Mémoires (1705), and his masterpiece, Le Sénateur Unhappy (1758), three years before his death, and so suddenly as to originate various contradictory reports, 4th September 1709.
ment of temperature, latent and specific heats, and especially the numerical data bearing on the working of steam-engines, for which the Royal Society of London awarded him their Rumford medal (1829) of the Royal Society, and was one of its foreign members. In addition to numerous papers in the Annales de Chimie, &c., he published a Cours Élémentaire de Chimie (4 vols. 14th ed. 1824), and a translation of the works of Regnault, the French chemist (2 vols. 1837.)

Regnier, Mathurin, a great French satirist, was born at Chartres, 21st December 1753. His father was a well-to-do citizen; his maternal uncle was the Abbé Desportes the poet. The boy was tonsured at nine, but grew up dissipated and idle. In early youth he seems to have visited Italy in the suite of the Cardinal de J Boucicaut, and is supposed later to have transferred his services to Philippe de Bethune, who went as ambassador to Rome in 1691. He obtained a canonry at Chartres, and enjoyed the favour of Henry IV. and his court. But his follies were his health, and he died an untimely death, 13th October 1713. His first collection of satires had appeared in 1688. Regnier's whole work together scarce exceeds 7000 lines—sixteen satires, three epistles, five elegies, and some odes, songs, epigrams, and miscellaneous pieces—yet if it be true that the order of birth is among the poets of France. He is greatest in his satires, written in the usualAlexandrine couplet, and admirably polished, yet vigorous and original. They touch social and moral questions only, and consequently are not of merely ephemeral interest, as political satires many often are; and, what is rare in French satire, they mostly escape the fault of handling abstract types instead of actual concrete embodiments of the type. Breadth, force, and reality characterise them all, but these merits together reach their highest point in the thirteenth, Marcette, a satire on a hypocritically old woman who corrupts the hearts of the young around her by her cynical views of life. Regnier imitated indeed the satire of Juvenal and Horace, yet he did not copy it, and he throw his own into new the form he bore himself was defended by the senators as a poet, and it was a model of the most supreme heroism, how Regnault at first refused to enter Rome since he was no longer a citizen; how, after this conscientious scruple was overcome, he declined to give his opinion in the Senate till that illustrious body laid upon him its commands to do so; how he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners; and now, after he had succeeded by his earnest appeals, the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though consciences of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Cartaghe, where the rulers, mankind by the failure of their schemes through the influence of Regnault's unflinching bravery, and the most horrible tortures. The common story is that he was placed in a cask or chest stuck full of nails, also that, with his eyelids cut off, he was exposed to the glare of the African sun. Unfortunately this noble tale of heroic patriotism and unflinching fortitude is unhistorical, or at least unsupported by any good authority.

Regnault, or Rule, St, according to legend, a monk of Constantinople or bishop of Patras who in 347 A.D. came to Muckross or Kilriment (afterwards St Andrews), bringing relics of St Andrew to Scotland from the East. The adoption of St Andrew as the national patron saint appears to belong to the first half of the 8th century; and for the possible identification of St Regnault with an Irish St Ringail of the 6th century, see Skene's Celtic Scotland (vol. ii. 1577).

Regn, the rich, black cotton soil of India. It is the result of the long-continued growth and decay of vegetation—the organic residue being commingled with the disintegrated and decomposed debris of the subjacent rocks.

Rei. See MILREI.

Reichenbach, a manufacturing town of Saxony, 11 miles SW. of Zwickau, produces woollen fabrics—merinoes, flannels, shawls, quilts, cashmeres—and has wool-spinning, dyeing, and calico-printing works. Pop. (1890) 21,496.

Reichenbach, a town of Prussian Silesia, 46 miles by rail north of Liegnitz, on the river Lina.

Reichenbach, Heinrich Gottlieb Ludwig (1793-1879), a botanist and zoologist, from 1829 a professor at Dresden.—His son, Heinrich Gustav (1824-90), was also a botanist, a professor at Hamburg from 1862. He was famous in connection with amphipods.

Reichenbach, Karl, Baron von, naturalist and zoologist, was born at Stuttgart, 12th February 1788, and educated at Tübingen. After a short political imprisonment at the instigation of the French authorities, he studied the industrial arts, and in 1821, in connection with the Count of Salm, he commenced a number of manufactories of different kinds at Blansko in Moravia, which he managed with great success, retiring with a fortune. He devoted much study to the compound products of the distillation of organic substances, and he succeeded in bringing to light a number of...
compounds of carbon and hydrogen not previously known; among these were erastece (1833) and paraffin. Studying with enthusiasm the subject of animal magnetism, he discovered, as he thought, a new force in nature, which he called Od (q.v.), and conceived to be intermediate between electricity, magnetism, heat, and light, and recognisable only by the nerves of sensitive persons. His chief work, however, is his Landscape Work (1834), Untersuchungen über die Dynamik des Magnetismus (1847-49), several works on ‘odic force’ (1852-58), Aphorismen (1866), Die Oidische Loke (1867). Several of his works have been translated. He died at Leipzig, January 19, 1869. See biographical works by Schröter (1869) and Fechter (1876).

Reichenberg, the chief seat of the cloth manufacture in North Bohemia, stands on the Neisse, 86 miles by rail NE. of Prague. Apart from the principal industry, in which, in the town and neighbourhood, some 10,000 workmen are employed, cotton and woollen fabrics, machinery, and leather are the cloth industries, established here in the 16th century. There is an important industrial school. Pop. (1890) 31,033.

Reichenhall, an Alpine spa in the extreme south-east of Bavaria, 10 miles SW. of Salzburg. It was almost wholly consumed by fire in 1834, and has been handsomely rebuilt. It is the chief centre of the Bavarian salt-works, and in the manufacture of salt (11,800 tons annually) its 3436 inhabitants are for the most part employed, though the delightful air of the valley in which it stands, and its saline springs, attract about 6000 visitors every summer. The salt-springs are fifteen in number, and lie at a depth of 50 feet; two of them yield 25 per cent. of salt. A brine conduit, 75 miles in length, conveys the water of the salt-springs from Berchtesgaden, through Reichenhall, over mountain 1150 feet high, to Traunstein and Rosenheim, in the vicinity of which abundant timber for fuel is procurable.

Reichstadt, Duke of. See NAPOLEON II.

Reid, Captain Mayne, writer of boys' stories, was born in County Down in 1818, and at twenty emigrated to America, where he led a vigorous and adventurous life, served in the United States army during the Mexican war of 1847, and distinguished himself especially in the storm of Chapultepec. The Hungarian struggle, in which he had meant to take part, was at an end before he reached Europe, whereupon he settled down to a literary life, first at London, next in Buckinghamshire. He died October 22, 1883. His vigorous style and the profusion of hairbreadth 'snaps' he provided delighted his breathless readers, who did not stop to notice the truthfulness of his scenery and the occasional excellence of the narrative style. Among his best books were the Boy Hunter (1853), the Bush Boys (1856), and the Boy Ter (1869), the Scalp Hunters (1847), the Rifle Rangers (1850), the War Trail (1857), and the Headless Hunter (1865). See the Memoir by his widow (1890).

Reid, George, P.R.S.A., was born at Aberdeen, 31st October 1841. After having been trained as a lithographer, he studied art in the Trustees' Academy, Edinburgh, under Mollinger at Utrecht, under Yvon in Paris, and with artists at the Hague. He A.R.S.A. in 1870, and R.S.A. in 1877, and succeeded Sir W. F. Douglas as P.R.S.A. in 1891. He is most widely known by his portraits, which are distinguished by unfinishing verismimitude, vigorous handling, and thorough modelling. His half- and full-lengths are remark-

able for their individuality of attitude, for the insight with which, in each case, the characteristics of the sitter are expressed by the entire figure, as well as by the face. Among his more important portraits are 'Lord President Ingils,' in the Scottish Parliament House; 'H. Wellwood Maxwell of Munchers;' and 'John MacKenzie.' He has also produced many rich, freely painted flower-pieces, as well as landscape work of a delicate and quiet charm; and his book illustrations prove him one of the most accomplished of living draughtsmen.

Reid, Thomas, head of the Scottish school of Philosophy, was born on the 26th April 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. His mother belonged to the well-known family of the Gregories (q.v.). Reid began his education at the parish school of Kincardine, and at the age of twelve he became a student of Marischal College in Aberdeen. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the natural philosophy of Newton. In 1736 he left Aberdeen, and went to England, where he was introduced to the most distinguished men in Oxford, Cambridge, and London. In the following year he was presented by the senators of King's College to the parish of St. Mary of Fullerton in London. In 1748 he was led to seek a new foundation for the common divines. In 1739, Hume's Treatise on Human Nature appeared, the perusal of which gave the impulse that determined Reid's future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn by Hume. The result of this was that it was led to seek a new foundation for the common divines as to a material world. In 1748 he contributed to the Royal Society of London a short essay on Quantity. In 1752 he was appointed one of the professors of Philosophy in King's College, Aberdeen, the summons being the part of the patron of the chair. Here he followed the established course of teaching in three successive years to the same students mathematics, natural philosophy, and moral philosophy. He was the founder of a Literary Society in Aberdeen, which enrolled among its members Campbell, Beattie, and other men of ability; and in this society he submitted his first draft of the Inquiry into the Human Mind. In 1763 he was chosen to succeed Adam Smith as professor of Moral Philosophy in the university of Glasgow. In 1764 he published his Inquiry. His third for general science never left him; at the age of fifty-five he attended Black's lectures on Heat. He continued in the duties of his chair till 1798, when he retired to devote his remaining strength to the publication of his works on the mind. In 1783 the Metaphysics and Experiment of Human Understanding was published, and in 1788 the Active Powers—together forming a systematic work on the science of the human mind. In 1774 he had contributed his account of Aristotle's logic to Lord Kames's Sketches. The publication of the Active Powers was the close of his career as an author, and at the end of his life he set up his bodily and mental vigour and his interest in science. He was taken ill suddenly in the autumn of 1796, and died on the 7th October.

Like Kant, Reid was roused to metaphysical research by Hume and became the chief of a school whose aim was to deliver philosophy from scepticism, and to do so by resting finally on principles of intuitive or a priori origin. The Scottish philosophy, dominant till Sir W. Hamilton's time in Scotland, and influential in France (see ROYER-
REIGATE

Collard), found azealous defender in McCozi (q.v.).

See Common Sense, Scottish Philosophy; the Life by Dagald Stewart prefixed to Reid's works (4 vols. 1803); the edition by Sir W. Hamilton (1833); McCozi's Scottish Philosophy; and Campbell Fraser's monograph (1838).

Reigate, a thriving market-town of Surrey, pleasantly situated at the southern base of the North Downs, 21 miles S. of London. Of the castle of the Earls of Warrenne little remains save a grassy mound, with large vales or caverns beneath it. The church, with Transition Norman pilers, has a mainly Perpendicular, contains the glass of Lord Howard of Effingham, is a library (1701) with some curious MSS., and many of Evelyn's books. Other buildings are the public hall (1801) and the grammar-school (1675). Foze the martyrlogist is claimed for a resident; and Arch. Bishop Usher died here. Till 1832 Reigate returned two members to parliament, and then one till 1867. It was incorporated as a municipal borough in 1863. Pop. (1851) 4927; (1891) 18,062; (1911) 22,646.

Reign of Terror. See Danton, Robespierre.

Reiklavik. See Iceland.

Reimarus, Hermann Samuel, scholar and theologian, was born 22 Dec. 1719, at Hamburg. He studied at Jena and Wittenberg, travelled afterwards in Holland and England, and was on his return elected rector of the school at Wissarn, and subsequently professor of Hebrew and Mathematics at the gymnasium of Hamburg. He died there, 1st March 1758. He is the author of the so-called 'Wolfenbüttelsche Fragmente eines Ungejammerten,' first published by Lessing in 1777. These 'Fragmente,' up to that time only known in MS., by a few of Reimarus' most intimate friends, produced the profoundest sensation throughout Germany; since in these works the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. Another work in the same direction is his Vorgenommenen Wahrheits- Wahrheiten der Naturlichen Religion; of a miscellaneous character are his Prinzip Wissemirenza, De Vita Priscorum, and his edition of Dio Cassius. See the monograph by D. F. Strauss (1860; 2d ed. 1878).

Reims. See Rheims.

Rein. See Bricke, Riding and Draying.

Reindeer, or Caribou (Rangifer tarandus), a species of deer, the only representative of the genus. It is a native of the northern parts of Europe, Asia, and America, and was introduced into Iceland in 1770. In Caithness it exists till the middle of the 13th century (Harting's Extinct British Animals, 1830). It is by far the most valuable of the deer, for not only are the flesh and skin of much use, but the animal has long been domesticated, especially among the Laplanders. The wild reindeer of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest being generally attained in the polar regions. The domesticated animal is never so large as the wild one, but that of Siberia, and the wild ones much larger than that of Lapland. The reindeer is strong, somewhat heavily built, but yet very swift. The hair is longer in winter, and is gray or brownish in colour. The legs are short and thick, and the broad main hoofs spread out as the animal moves; but in the snow, hoofs, there are two necessary lateral hoofs. The head is carried horizontally, not erect as in other deer. The muzzle of the nose is hairy. The antlers are large and are unique in being possessed by both sexes. Moreover, they begin to appear at an early stage in life, within a few weeks after birth, and at the same time in both sexes, whereas in the other deer, in which only the males have antlers, they do not appear before nine months or more after birth. In the female the antlers are somewhat smaller, thinner, and less branched than in the male, and are retained through the winter until the breeding season in spring, after which they are cast. 'The male, on the other hand,' Darwin notes, 'casts his horns much earlier, towards the end of November.' There is great variability in the antlers; there is a "bez tine" as well as a "large tine" for the peculiar in being either branched or palmate. In summer the Lapland reindeer feeds chiefly on the shoots of willow and birch, while in winter it depends mainly on lichens such as the so-called reindeer moss. It seems that they use both their antlers and their hoofs in removing the snow which hides their food. The animals run swiftly, but not gracefully, taking long sliding strides, and their hoofs snap together as they run. In their natural life the reindeer are gregarious. They migrate from the mountains to the lowlands in winter, and return again in spring, a change in part dependent on the food-supply. Moreover, by leaving the lowlands in spring they free themselves from the gnats and gadflies, which trouble them very seriously. It is said that the Lapps have to move their herds near the coast in the summer if the health of their stock is to be preserved, and sometimes an immense herd will rush in a headlong race to the sea.

In North America and elsewhere the reindeer is hunted for the sake of its flesh, fat, and hide. They are shot or trapped in snow pits. The flesh and fat are used in a fresh state or made into pemmican. The skin is used in many ways—for clothing, bedding, and the like. To the Laplanders the reindeer serves as a substitute for horse, cow, sheep, and goat, but its domestication is not very complete. It constitutes the chief part of the Lapp's wealth, and some possess tame herds of two thousand or more, which feed chiefly in the mountainous regions in summer and in the lower grounds in winter. The animal can maintain a speed of nine or ten miles an hour for a long time, and can easily draw a weight of two hundred pounds besides the sledge. Almost every part of the dead animal is used in some way. The reindeer also yields excellent milk.

Reindeer Moss (Ceramomyxa rangiferina or Ceramomyxa rangiferina), a lichen of great importance to the Laplanders and other inhabitants of the northernmost regions of Europe and Asia, as forming the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in the Arctic regions.
It is common in Britain, growing in moors and on mountains. It covers extensive tracts of Yorkshire, and other very northern countries, making them even in summer as white as snow, and often thus occupies the ground in pine forests. When pine forests are destroyed by fire it soon springs up in its greatest luxuriance. It is a very variable plant, and there are two distinct forms, one cylindrical tubular thallus, with small perforations in the axis. It attains a height of two inches and upwards. The branches of plants which grow together usually mix very intricately into one mass. The importance of this lichen was first brought to the notice of Linnean, and it was observed to reach it by seraping, even when it is covered with very deep snow. It is capable of being used for human food, though its taste is slightly acidic. Its nutritious qualities depend on Lichenin (q.v.).

Reinecke Fuchs. See REYNARD THE FOX.

Reinhenks, Joseph Hubert (1821-96), was born near Aix-la-Chapelle, where he worked in a factory before he studied for the priesthood. In 1842 he was ordained at Beverley, and in 1843, he a strenuous opponent of the infallibility decrees, was chosen bishop by the Old Catholics (q.v.).

Relapsing Fever (also known as famine-fever and seven-day fever) is one of the three great species of continued fever, the two others being typhus and typhoid. It was first definitely described from tropical diseases by Dr. Henderson of Edinburgh and other Scottish physicians about 1842, but it can be traced back with certainty in the records of disease a century farther, when it was prevalent in Ireland and Scotland. During the 19th century it has been met with in those countries in the West Indies, in southern Europe, the countries surrounding the Mediterranean, Australia, the North and South Pacific, etc. and, though never extensively, in North America. Relapsing fever usually begins suddenly with rigor, a sense of chilliness, and frontal headache. Febrile remission occurs in a week or ten days, and pulse usually over 100 per minute; the tongue is coated with a thick moist whitish fur; and the skin is often jaundiced (a phenomenon that never occurs in typhus or typhoid fever). There is severe aching pain in the joints and muscles, and great sleeplessness; but diarrhea, if present at all, usually comes on only towards the end of the first week. After the above-described symptoms have lasted for a period varying from five to eight days, generally on the seventh day, a sudden change takes place. The fever commences with a copious perspiration, which is followed by a rapid falling of the pulse and temperature to, or below the normal, and the patient appears nearly well. But from the fifth to the eighth day of this seeming convalescence a sudden relapse occurs, and all the primary symptoms return; these often run a rather shorter course than before, and again terminate in sweating and in a second convalescence, which is in most cases permanent. The relapse sometimes, however, occurs three or even four times. Death is a rare termination of relapsing fever; and when it occurs it usually takes place at the eighth day of the disease. No important anatomical lesion is constantly observed in the bodies of those who succumb to this disease, except enlargement of the spleen. One form of the disease, however, is much more severe, and very often fatal. It was originally described as a distinct disease under the name of bilious typhoid, and is characterized by more marked involvement of the digestive organs, by the constant presence of jaundice, and by absence or incomplete development of the crisis and intermission. It has now been shown to be really identical with relapsing fever proper. Relapsing fever is generally met with among those living under unfavorable hygienic conditions; it is especially apt to attack a population suffering from insufficient nourishment (hence the name famine-fever), and is seldom met with among the upper classes, or among Europeans residing in the tropics, unless they are brought closely in contact with the sick. At the commencement of the disease the patient will in some cases spreading either directly from the patient to doctors, nurses, &c., or from clothes and bedding to washerwomen, who have suffered severely in some epidemics. It was shown by Obermeier of Berlin in 1873 that an organism (Spirillum, q.v.) is constantly present in the blood of the subject suffering from the disease, and his results have been confirmed by numerous other observers. Moreover, a similar disease has been produced in monkeys by inoculation with the organism, which has also been found in their bodies after death. There can be no doubt, therefore, that this spirillum is the cause of the disease (see GERMAN THEORY OF DISEASE). Though relapsing fever has been abundantly proved to be distinct from typhus, they are often associated in a curious way; epidemics of the two diseases have frequently been observed to occur in the same place either simultaneously or successively.

Treatment. The patient, as in other febrile diseases, must be kept in bed; an emetic at the commencement of the attack is often useful, and aperients may be required; a light but liberal diet should be given. Opiates are frequently necessary to relieve the pain and sleeplessness. No means have yet been discovered for cutting short the disease or preventing relapses.

Relations, Maintenance Of. According to English law, a husband is bound to maintain his wife; if he is not, it is impossible for her to live with him, she has an 'mthority of necessity' to pledge his credit for the necessities of her life. Under the statutes relating to the poor a husband may be punished for deserting his wife, and compelled to provide for her maintenance; the husband of a lunatic wife may be compelled to contribute to her maintenance in an asylum. Under the Married Women's Property Act, 1882, a woman who has property may be compelled to contribute to the maintenance of her husband. A woman is not legally bound to maintain a child; but he may be indicted for not supplying an infant child with necessaries. In like manner a child is not bound at common law to maintain his parents. But the poor-law of 1895 imposes a direct liability on the father, grandfather, mother, grandmother, or children of any person not able to work; and by a subsequent act a man who marries a woman having children (legitimate or illegitimate) must maintain such children. Bastard children are to be maintained by the mother, but the father may be summoned before justices and ordered to pay a weekly sum to the mother, or to a person appointed by the justices. A grandchild is not liable to maintain a grandparent, nor can a man be required to maintain persons related to him only by affinity (as e.g. a sister's or brother's child, or a brother-in-law's child (e.g. a brother or nephew). In Scotland the father, and failing him the mother, is bound to maintain children until they are old enough to earn a livelihood; a father refusing to provide for his child is punishable by fine or imprisonment. Parents have a claim on a child if his father is bound to maintain the indigent parents of his wife during the subsistence of the marriage. The father of an illegitimate child is bound to support it, and if the child is unable to earn a livelihood the obligation may last throughout its life. A husband is, of course, bound to support his wife; if he refuses to
do so she may sue for alimemt, and he is liable to her creditors for alimentary debts. In the United States the laws of the states vary; but the duty to support wife, children, and parents is generally recognized as a social duty, and in many states the law makes a penal offence for a man to abandon wife or children.

**Relative Keys.** See Scale. **Relative Rank.** See Rank.

**Relativity of Knowledge.** The doctrine of the relativity of knowledge is almost a commonplace in some philosophical schools, and is as strenuously denied by others. It is connected primarily with the contrast between the absolute and the relative, or the noumenon and phenomenon, and is one phase of the great discussion as to the relation of knowledge to reality. In its modern form the doctrine has obtained currency chiefly through the speculations of Kant, Hamilton, and Mr Herbert Spencer. Knowledge evidently implies a knowerto a relation between the knower and the object known. Hence it is argued that the object is conditioned by the relation into which it is brought; merely by becoming an object the thing as it is in itself undergoes a change or accommodation. Our knowledge therefore can never yield the reality of the thing-in-itself, but only the phenomenon, the thing as it appears to us. Or, as it is otherwise expressed, in being known the object must conform to the nature of the knowing faculty, the mental constitution or organisation of the knower; we cannot, therefore, conclude, says Hamilton, that the properties of existence are known "in their native purity and without addition or modification from our organs of sense, or our capacities of intelligence." Hamilton's general conclusion is: "Of things absolutely or in themselves, be they external, or internal, physical, or mental, we know them only as inseparable; and we become aware of their incomprehensible existence only as this is indirectly or accidentally revealed to us, through certain qualities related to our faculties of knowledge. All that we know is therefore phenomenal and relative. The thing-in-itself is adopted by Mr Spencer, and made the basis of his theory of knowledge, or rather of what Ferrier would have called his agnosiology, his doctrine of our necessary ignorance: 'The reality existing behind all appearances is, and must ever be, unknown.' In Kant's doctrine there is an asserted subjectivity of the forms of space and time; but it is also based upon the broader consideration that perception can give us 'only the relation of an object to the subject, not the inward essence which belongs to the object in itself.' The empirical schools, which resolve our knowledge into impressions of sense manipulated according to the laws of association, likewise accept in its widest sense, as J. S. Mill points out, the doctrine of 'the entire inaccessibility to our faculties of any other knowledge of things than that of the impressions which they produce in our minds consequent upon them.' But, inasmuch as they in many cases profess a sceptical idealism which denies, or leaves doubtful, the existence of any reality beyond the states of consciousness, their views are less usually associated with the term.

The starting point of the above argument must be conceded by all. Knowledge obviously implies relation; it exists only through the duality of knower and known, this duality being as necessarily present in the case of what is called self-knowledge as in the case of knowledge by self of independent objects. But the upholders of the doctrine of relativity proceed to convert this essential feature of intelligence into a proof of the 'impotence' of our faculties. For the term is used in such a way as to imply a taint or defect in our knowledge. Our knowledge is condemned because it fails to realise a certain ideal. The question arises, however, whether the ideal conceptions are in any sense legitimate or possible. What is this 'reality existing behind all appearances,' this thing in itself that so persistently eludes our grasp? The answer of a sound philosophy would seem to be that this unknown essence or noumenal reality is a fiction, the feature of our own constitution. The essence or nature of a thing is expressed in its qualities or action; the noumenon reveals itself in the phenomenon. The relativists are in the habit of saying that 'we know only phenomena,' thus making our knowledge of phenomena the ground of our ignorance of the corresponding noumenon. It is strictly speaking, it is a misuse of language to say that we know phenomena: the phenomenon is our knowledge of the noumenon. To say that we know phenomena is therefore only a roundabout way of saying that we know, and what we know is the noumenon or thing-in-itself. Of course the contrast between knowing and being is not abolished according to this view: in human knowledge, at all events, the existence of objects is independent of our knowledge of them. It is this contrast between the thing as existent and the thing as known that lends particular weight to the doctrine of relativity. But the contrast only justifies us in saying that knowing a thing is not the same as being that thing; whereas the relativistic doctrine says that, ipso facto, to know a thing is not to know the reality of that thing. Knowledge, in this view, is usefully cast off from knowledge.

Apart from this general line of thought, the doctrine is frequently based upon the large extent to which sensation enters into all our knowledge. In the structure of their sense-organs different living creatures have a different amount of sensation; and there may be a corresponding difference in the image of the world which they make to themselves. The knowledge of every being, it is argued, is thus inevitably conditioned by its organisation, and there is no possibility of arriving at an objective criterion. Man, in the Protagorean form of the term, is the measure of all things; but he measures them only as they seem to him. Such a formula may be interpreted either in a sensualistic and individualistic fashion, as seems to have been done by Protagoras, or in a rationalistic and humanistic fashion, as is seen in the Kantian form of the term. There is a sceptical dissolution of knowledge, for it leaves no common ground on which individuals might meet. Kant, by making space and time, if not the categories also, forms peculiar to the human intelligence, but common to all men, provides for objective truth between man and man, but insists on the merely human and relative character of such truth. Apart from the assertion of the merely subjective character of space and time, which Kant can hardly be said to have proved, it is evident that the relativist argument applies with force to what are called 'boundary qualities,' such as tastes, smells, sounds, and colours. But when we consider the elevated pleasures of which the last two, at all events, are the source, we may well hesitate about pressing the relativistic argument too far, for the things do not always account as bald brute facts, on which intelligence afterwards supervenes, to make what use of them it can. It seems truer to believe that to be known and enjoyed by spiritual beings is the purpose of their existence. The relativity of the world to the human senses and intellect would then form no ground for believing that the image of the world thus obtained was in any sense distorted or untrue. We may rise to higher insight and more perfect esthetic appreciation, but that our know-
Relics (Gr. leptaiwma, Lat. reliquiae, 'remains'), personal memorials of those among the dead who have been distinguished during life by eminent qualities. Under this head fall the remains of objects which derive their value from their connection with our Lord and with the saints; as, for example, fragments of our Lord’s cross or crown of thorns, portions of the dust, the bones, the blood, the instruments of torture, the chains, &c. of the martyrs, the mortal remains, the clothes, the boots, and other objects of personal use of the other saints. With them may be grouped objects to which a certain indirect sacred interest is given by their being brought into contact with the direct memorials of the distinguished dead, as by their being placed on the tombs of the martyrs touched with the relics, or blessed at the shrine or sanctuary of the saints, &c. Reverence for relics developed with the increasing honour paid to Martyrs (q.v.).

The earliest monuments of Christian history connected with relics were the votive offerings of devotion with which martyrs of the faith, their mortal remains, and everything connected with their martyrdom were regarded by their fellow-Christians, and for which Catholics profess to find warrant in many passages of the Old and of the New Testament, as Ex. xxii. 21; Lev. xxvi. 14; xxi. 18; Matt. ix. 20–22; Acts, v. 12–16, and xix. 11, 12. The letter of the Church of Smyrna attest this plainly as to the martyrdom of Polycarp; Pontianus’ Life of Cyprian tells of their stealing the martyr’s body, and carrying it away by night in holy triumph. The Apostolical Constitutions bear witness to the honours paid. Miracles, too, are described as connected with relics. Thus, Ambrose tells of a blind man’s sight restored by his touching the bodies of the martyrs Gervasius and Protasius; and similar wonders are detailed by Gregory Nazianzen. Christian converts, knowing that the possession of relics of the martyrs, and even the occasional touching of them, was regarded as a special happiness. According to Theodoret, even cities were content to share with each other portions of relics, and so connected with this feeling, too, is found a belief of a more meritorious efficacy in the presence or the touch of the relics; and especially there is ascribed by Chrysostom, Basil, Theodoret, and other Fathers, to prayers offered before the relics, a virtue in dispelling or warding off sickness, diabolical machinations, and other evils. Hence we find that altars were erected over the tombs of the martyrs, or at least that relics were invariably placed on the altars, wherever erected; insomuch that the Trullan Council ordered the demolition of all altars in which relics were not placed. Relics, therefore, were sacred and the relics of martyrs was the cross of our Lord, which was believed to have been discovered at Jerusalem by Helena (q.v.), mother of the Emperor Constantine. Minute portions of the wood were attributed to the principal churches; and Cyril of Jerusalem, in a council after the discovery of the cross, describes the precious wood as dispersed throughout the world. According to Rohlani de Flency’s Memoire sur les Instruments de la Passion, 'the total cubic volume of all the known relics of the True Cross is about 5,000,000 cubic millimetres, whereas one cubic millimetre is enough for the execution of a man must have contained at least 180,000,000 or thereby.' The practice of relic-worship, and the feeling on which it was founded, were not suffered to pass without a protest. At quite an early period many abuses and superstitions had crept in, even the Fathers who admit the worship do not fail to condemn; and Vigilantius, in his manuscript, reproved in the strongest terms the excesses to which it was carried, and indeed the essential principles on which the practice rests. He had so few followers, however, that were it not for the reftutation by Jerome of his work against relics we should not have heard of this hostile opinion to the popular view; and it is urged by Catholics, as a proof of the universal acquiescence of the church of the 4th century in the practice of relic-worship, that it was not even found necessary to call a single council to condemn Vigilantius.

The writings of Augustine, of Pelagius, of Nola, of Ephraem the Syrian, of Gregory the Great, and others are full of examples of the miraculous virtue ascribed to relics, and of the variety and the extensive multiplication of sacred memorials of all kinds. Nor was this confined to the orthodox alone; all the different parties within the entire opposition on the Incarnation agreed with Catholics and with one another on this subject, and even the Iconoclasts, at the very time that they most fiercely repudiated the use of images, admitted without difficulty the miraculous relics.

In the age of the Crusades a fresh impulse was given to the worship of relics in the West by the novelty and variety of the sacred objects brought home from the churches of Syria, Asia Minor, and Constantinople by crusaders, by pilgrims returning from Palestine, and by the benevolent operations of the University of Paris, and it is admitted by the most zealous Catholics that at this period many false, and perhaps even absurd and ridiculous relics were introduced, and were successfully commended to the veneration of individuals or individual churches in the West; nor do they pretend to doubt that abuse and superstition found their way side by side with what they regard as the genuine and authorized worship of the church. Nevertheless, with the exception of the Walsenses, Wyclif, and a few isolated individuals, the practice remained unchallenged till the 16th century, when, with the growth of the scholasticism and practices of the Church of Rome, it was utterly repudiated by the Reformers. Catholics, however, allege that the practice, as sanctioned by the church, has nothing in common with the abuses which form the main ground of the objections alleged by Protestants. The Catholic Church uses of relics, as authorised by the church, is to serve as incentives to faith and piety, by recalling vividly to men’s minds the lives, and, as it were, the corporeal presence and the earthly converse of the saints, and thus placing before them, in a more touching manner, the virtues which, in the examples, are held up for men’s imitation. The decree of the Council of Trent connects the subject of relic-worship with the general question of saint-worship, and regards the relics of the saints not as possessing themselves, but as perhaps assisting, even through which God bestows benefits on men.’ The Fourth Lateran Council (1215) forbade the sale or veneration of relics until their authenticity had been approved by the authorities; the Council of Trent renewed the prohibition. In the pastoral Epistle of the Bishop of Rome of 1884, and in any other document of the Holy See (1891), it is expressly stated that ‘the authenticity of no relic, be it the most eminent of the oldest church of Christendom, falls under any precept of Catholic faith.’ Relics are usually venerated in church courts, ‘reliquaries’ set on the altar; they are also carried in procession, and the faithful are blessed with them.

The Greek and other Oriental churches, and most of the Oriental sects, agree with Roman
Relief, as distinguished from 'sculpture in the round,' is one of the oldest forms of mural decoration, and in many cases is a subordinate department of architectural art rather than a branch of sculpture proper. It is low relief (bas-relief, basso-ribo) not to exceed (mezzo-rilievo), and high relief (alto-rilievo) according as the carved figures project very little, in a moderate degree, or in a very considerable degree from the background. The ancient Egyptians practised a peculiar kind of low relief and intaglio combined (see Egypt, Vol. I, p. 237). The walls of Tarsos (q.v.) and Babylon (q.v.) are mostly in very low relief. The Elgin Marbles (q.v.), from the Parthenon of Athens, are the most notable example of high relief. See SCULPTURE.

Relieving Officer. See POOR-LAWS.

Religion. The term has since the 16th century become naturalised in most European languages. It has even in the Tentric tongues taken the place of the native terms formerly in use. As to its etymology, the derivation from religionis is universally recognised to be inconsistent with phonetic laws; the necessity for assuming the existence of a lost transitive verb ligere, 'to look,' has not been made out. There is a relief (relegere) (Cicero, Nat. Deor. ii. 28), which implies carefulness and attention to what concerns the gods to be the primary signification of the word, is better than that from religare (Lactantius, Just. Div. iv. 28), which refers the origin of religion to a sense of dependence or connection with Deity by the bond of piety, insomuch as the latter does not accord with the way in which the ancient Romans used the terms religiosus and religiosus, and supposes in them a higher conception of religion than they are likely to have possessed. The Latinisation of derivation, however, has not been shown to violate any known linguistic law; and the reason which Professor Max-Müller gives (Natural Religion, p. 35) as 'the real objection' to it does not apply to it at all. It is not 'the fact that in classical Latin religare is never used in the sense of binding or holding back.' Binding or holding back, or behind, or fast, is its common meaning in classical Latin; it is its meaning in Caesar, Cicero, Suetonius, Virgil, Horace, and Ovid. Its only other meaning is to unbind.

General terms equivalent in meaning to religion and often used as synonyms, though not in every case exactly so, are: Enn, as Chinese, Sanskrit, Hebrew, or Arabic, and need not of course be looked for in the languages of uncultured peoples. There is no definition of religion in the Bible, nor any designation or description of it which applies to the heathen religions. The Fathers of the Church therefore very suitably attempted a definition of true religion. The difficulty of framing a correct definition of religion is very great. Such a definition ought to apply to nothing but religion, and to differentiate religion from everything else, as, for example, from imaginative ideation, art, morality, or philosophy. It should apply to everything which is naturally and commonly called religion; to religion as a subjective spiritual state, and to all religions, high or low, true or false, which have obtained objective historical realisation. And it should neither expressly nor by implication exclude any essential element of religion, but express in a general way all that is necessarily included in its nature, indispensable to its notion. Since the need for definitions of this kind was felt,—i.e. since the comparative study of religions began to be cultivated,—many attempts to supply it have been made, but few, if any, of the definitions of religion as yet proposed fulfil all the requirements. Those of Kant, Fichte, Schleiermacher, Hegel, Strauss, Wundt, Pfeiderer, Herbert Spencer, Matthew Arnold, Tyler, John Caird, and Max-Müller have attracted no particular attention.

The classification of religions also presents great difficulties. To distribute them into (1) true and false religions, or (2) natural and revealed religions, or (3) natural and positive religions, or (4) religions of savage and of civilised peoples, or (5) book-religions and religions not possessed of sacred books, or (6) individual religions (i.e. founded by great individual teachers) and national or race religions (i.e. the collective products of peoples or races, the growth of generations), must obviously be scientifically inadequate and unsatisfactory, although such classifications are received by many, and may not be without truth or interest. Max-Müller holds that 'the only scientific and truly genetic classification of religions is the same as that of languages;' and Maurice Vernes that they must be classified according to races. And there can be no doubt that, if religions, languages, and races are properly classified, the classifications will, on the whole, correspond or coincide. Still they ought to be classified independently, from a study of their own proper natures, and a complete accordance of their classifications is not to be looked for. The fact, for instance, that natural religion is not confined to races not limited by language or race, must not be ignored or depreciated. Hegel's classification is very ingenious and suggestive. He distributes religions into religions of nature, religions of spirituality, and the absolute or Christian religion, answering respectively both to the chief stages of the historical realisation of religion, and to the childhood, youth, and manhood of humanity. The religions of nature are represented as including (1) immediate religion (sorcery and fetish-worship); (2) pantheistic religion, which comprehends the religion of the nations (China), polytheism (India), and theism (Brahminism), and the religion of being-in-itself (Buddhism); and (3) religion which tends to freedom, and which is exemplified in the religion of the good or of light (ancient Persian), the religion of sorrow (Syrian), and the religion of mystery (Egypt). The religions of spirituality are held to be these three—the religion of imputation (Hebrew), the religion of beauty (Greek), and the religion of the understanding (Roman). The classification of Von Hartmann is of the same character, being very ingeniously conformed to the needs of his own philosophic system. He brings all religions into a scheme of distribution with the facts. The classifications of Lubbock, Tyler, Spencer, Reville, and Dalviella deserve attention as being based on an extensive and close study of religions, including those vague and rude religions to which it is especially difficult to assign appropriate names. The absence of agreement in the scheme of distribution. No general agreement, however, has been as yet reached either in determining the species of these religions or the order of their succession.

Professor Tiele classifies religions as follows:—1. Natural religions, which comprehend (a) Polytheistic magical religions under the control of animism; (b) Purified or organised magical religions—Therianthropic polytheism, (1) unorganised and (2) organised; (c) Worship of manlike but
superhuman and semi-ethical beings—Anthropomorphic polytheism. II. Ethical religions, which are either (a) National nomistic (nomothetic) religious communities—Taoism, Confucianism, Brahminism, Jainism and Primitive Buddhism, Manichaeism, and Satanism; or (b) Universalistic religious communities—Islam, Buddhism, Christianity.

Religion is virtually universal, although, of course, neither the possibility nor the existence of atheism can be reasonably denied. The instances which historical religion has afforded of a distinction between the two have, it must be noted, not been such as to prove that there are whole peoples destitute of religion who will not stand the test of examination (see Flint, Antithetic Theories, Lecture vii. and Notes xxv.—xxxi., and Roskoff, Religionswesen der rohesten Naturvölker). Not one adequately attested case of the kind has yet been produced; and even if such a case were established it would go only a very little way towards proving that man is not naturally and normally a religious being.

The starting-point of religious development has been variously represented as fetishism (De Breul, Fétichisme), animism (Spantini, La Nature et L'Homme), Caspari, Le Bon), polytheism (Hume, Voltaire, Dupuis), pantheism (Tholuck, Ulrici, Caird), henotheism (Schelling, Max-Müller, von Hartmann), and monothelism (Creuzer, Professor Rawlinson, Canon Cook). All these representations are consistent with the process of knowledge by which we are not enabled to decide what the primitive religion was. Historical research does not take us back to it. Nor does it show us what stages of religion intervened between it and the earliest known historical religions. The problem of which the religious phases of religion are represented by anthropologists and comparative theologians as having succeeded one another are merely more or less suggestive hypotheses, based on data both insufficient and ambiguous. All serial arrangements of the kind have to be regarded as of a merely logical, non-historical and non-chronological kind, although they may, perhaps, aid in leading to a discovery of the historical order of development. Hence the best mode of arranging the religious phases is to begin with the logically simplest phase of religion, and pass on the other phases in their logical order of their logical dependence and complexity. Adopting this principle, Naturism, the worship of natural objects regarded as powers or agents will come first, implying as it does no original or special faculty or tendency, and being the direct and natural interpretation of physical facts. It may have many forms corresponding to the differences of the natural objects, and these forms may imply very different degrees of intellectual capability and very different qualities of disposition in the worshippers, although they have certainly not been shown to be successive stages of religious development. Nature-worship affords a basis for all other forms of religion and worship, and in most of them its presence as a constituent is obvious. It is difficult, if not impossible, to conceive how men would have arisen to worship a special object of religion except by means of it; or how they could have failed to enter it unless raised above it by a special revelation. And the notion of a special revelation to men who had not by natural means acquired any belief in or thought of deity is scarcely conceivable. It has been noted that the growth of the idea of soul is often indistinguishable or difficult to distinguish from nature-worship, which is, as it were, implicit animism, while animism is explicit nature-worship. When there is a distinction between body and life or soul, it is natural that he should work it out in regard to himself, and then judge of other things by himself; and the phenomena of sleep and dreams, of swooning, apoplexy, ecstasy, insanity, and death, all contribute to mould his thoughts when once they have been turned in this direction. Hence a third phase of religion, Spiritism, in which the souls worshipped are human, or at any rate created as the result of a natural process, is received according to human experience, but affected and modified by physical impressions and analogies. The hypothesis of Mr Spencer that religion begins at this stage, the first deities being deceased ancestors, and the first worship funereal rites, takes no account of a vast mass of philosophically natural evidence which establishes that the names of the oldest known gods were descriptive of natural phenomena, and of historical evidence which shows that ancestor-worship has been created in various localities on an older nature-worship. It also rests on a very improbable assumption as to savage man's mode of viewing natural objects worshipped, and fails to explain the common features, similarities, and analogies in the various mythologies, the transformations of the ghosts into gods, the inferior position of properly ancestral gods, and especially the characteristic features of the successive phases of religious development are Polytheism in the special sense of the term, anthropological mythology, the worship of divine individualities, generally in origin nature-gods, but transformed by imagination operating under the belief that beings analogous to things familiar in the order of things. The fifth phase is that in which polytheism is subordinated to, or reduced under, a Dualistic or Monistic conception of the divine. The conception may be mainly reached either by speculative or ethical thought. The sixth phase is represented by the Monotheistic religions—the Jewish, Christian, and Mohammedan. These religions all claim to rest on special revelation. In them only is belief in a plurality of gods entirely transcended. Philosophical monism in a religion does not cast out polytheism. Polytheism, image-worship, totemism, shamanism, and sorcery probably should be regarded not as distinct phases or natural logical stages of religious development, but as adjuncts and incidental perversions of religion which presuppose its normal or logical phases or stages. Insufficient and inadequate proof of this view would necessarily dislodge and destroy a number of current hypotheses.

The theories regarding the psychological origin and the essence of religion are numerous and divergent. It was common among the atheists of the 18th century to regard religion as the invention of individuals desirous of deceiving their fellow men in order to further their own selfish and ambitious views. Feneberg, Lange, Spencer, and others account for its appearance by imagination, illusion, or the misinterpretation of ordinary or exceptional phenomena. Some zealous super-naturalists have argued that it must have originated in a primitive revelation. It may be referred exclusively to the intellectual province of human nature. This mistake, however, is too gross to have been often committed, and sufficiently refuted by the obvious consideration that the measure of religion is not the measure of intelligence or of knowledge. Hegel did not, as is often said, fall into the error of identifying religion with thought, but only emphasised strongly the importance of thought in religion and regarded it as the basis of causality, and Max-Müller the perception of the infinite, as the roots of religion. And it may well be admitted that without both of these intellectual principles religion would be impossible. But are there more than merely conditions of its appearance? The only answer which can be given to intellect is that those who hold that God is known intuitively, perceived directly, apprehended with-
out medium; but both psychology and history, both internal analysis and external observation, seem to disprove this hypothesis. Religion has often been resolved into feeling or sentiment. Thus Lucretius, Hobbes, and Strauss have traced it to the following—the desire to secure life and its goods amidst the uncertainties and evils of earth; the disciples of Schleiermacher to a feeling of absolute dependence, of pure and entire passiveness; and others—e.g. Brinton and Newman Smyth—to the religious feeling as the distinction of primary feeling or a peculiar compounded feeling. Kant represented religion as essentially a sanction for duty, and Matthew Arnold has defined it as 'morality touched by emotion,' 'ethics heightened, enkindled, lit up by feeling.' This great diversity of views of itself indicates what investigation is found to confirm—viz., that religion is a vast and complex thing, an inexhaustible field for psychological study. Almost all the views referred to have some truth in them, and most of them are only false in so far as they assume themselves to be exclusive or when they are incapable of accommodating the whole truth. Hence it is comprehended in a comprehensive way which is so common. Thus understood, the Science of Religions may be said to deal with religion as a phenomenon of experience, whether outwardly manifested in history or inwardly revealed in religious experience. To seek to describe and explain religious experience as far as it can be described and explained without transcending the religious experience itself. Its students have only to ascertain, analyse, explain, and exhibit experienced fact. Were religion a physical fact, to study it merely as a fact would be enough. The astronomer, the naturalist, the chemist have no need to judge their facts; they have only to describe them, analyse them, and determine their relations. But it is otherwise with the students of religion, of morality, of art, of history. They must come to it, therefore, as judges of the phenomena and pronounce on their truth and worth. Experience in the physical world is experience and nothing more; experience in the spiritual world is very often experience of what is irrelevant and impious, immoral and vicious, ugly and degenerate. Has the means already to describe and analyse, accept, and be content with such experience? Even the logician and the aesthete will answer in the negative, will claim to judge their facts as conforming to or contravening the laws of truth and the ideals of art. Still more decidedly must the historian and the student of religion answer. Religion, then, is not completely studied when it is only studied historically. Hence it must be dealt with by other sciences or disciplines than those which are merely historical. What are these, and what are they relative to religion, the writer has elsewhere endeavoured to show.

All the particular theological sciences or disciplines treat of particular aspects or phenomena of religion or in particular ways. Their relationships one another and to other sciences can easily be determined. Further, they must be co-ordinated in a truly organic manner by their due reference to it. When religion is studied not merely in particular aspects and ways, but in its unity and entirety, with a view to its comprehension in its essence and all essential relations, it is the object of the Philosophy of Religion. Although this is a distinct and essential department of philosophy, and the highest and most comprehensive theological science, the philosophy of religion could only appear in an independent and appropriate form when both philosophy and theology were highly developed. It is, therefore, of comparatively recent origin, and indeed has been chiefly cultivated in Germany during the 19th century.

The Hibbert Lectures of Max-Müller, Renan, Kuenen, Rhylos Davids, Sayce, and Rhylos; Max-Müller's Natural Religion and Physical Religion; Tiele's Outlines of the History of Religion, and art. 'Religions' in Ency. Brit.; De La Saussaye's Lehrbuch der Religionsgeschichte; A. Lang's Myth, Ritual, and Religion; Revell's Religions des Peuples non-civilisées, & c., treat of the history of religion. Aliotti's Psychology and Theology, Newman's History and Development of Feeling, Tiele's Religions des Menschen, D. Greenleaf Thompson's Religious Sentiments of the Human Mind, Happel's Antike Altere des Menschen zur Religion, and Uriel's Gott und Mensch deal with the psychology of religion. There remain, however, the works on the history of the philosophy of religion—Pfeiderer's (trans. by Stewart and Menzies) and Pinner's (trans. in part by Hasting); also treatises on Religionspsychologie by Hegel, Krause, Olshott, Tante, Spul, Stölzel, Harzmann, Freudenburg, and Auwenhorst. Of works in English,
see books on the philosophy of religion by Morell, Caird, Morris, Lethe (trans. 1867), and Jevons. Introduction to the History of Religion (1896). There are, besides the relevant paragraphs on religion in the articles on Assyria, Babylonia, Egypt, Babylonian, Greek, Hindu, Japanese, and Chinese religions, various separate articles on the various religions of the world, sects and religions, and a final article on Rationalism.

Rembrandt

Rembrandt is a term much used in the law of England, if the owner of the fee-simple of land, or the freehold of lands, give them by will or deed to A for life, and after his decease to B and his heirs, the interest of B is called the remanent, because, after deducting A's life estate, all that remains belongs to B. A remanent is distinguished from a remainder in the following manner: if the land returns or reverts to the owner himself. Remanents are used in settlements for the purpose of fixing the succession and tying up the property, so far as the law will permit. See Perpetuity.

Remak, Robert (1815–65), physician and physiologist, became a professor in Berlin, and distinguished himself by microscopic work in pathology, and by the medical application of electric currents. He wrote works on the development of the vertebrates and on the medical uses of electricity.

Rembang, a town on the north coast of Java, capital of a residency that has an area of 2860 sq. m. and a pop. of 1,173,380. Pop. 10,000.

Rembrandter, the name 'Rembrandt' was a baptismal name only, which occurs in various forms. Rembrandt's initials were R.H.—i.e. Rembrandt Harmenszoon, or son of Harmen, and his father's full name was Harmen Gerritszoon van Rijn, or Harmen the son of Gerrit, living on Rhine-side. The local indication, van Rijn, is used in deeds after 1600 A.D. Rembrandt is now often called Van Rijn, but never Harmenszoon. At the time of the artist's birth his family was of the lower middle class, and in prosperous circumstances, living at Leyden, and holding property there. From the register of marriages and from a date on an etching, Rembrandt is known to have been born on July 15, 1606, as the true birth date. Rembrandt's father was a miller, and his mother, Neeltjen van Snuytbroeck, a baker's daughter. They had seven or eight children, of whom two died young, Rembrandt being the youngest but one. All the boys were brought up to the law, but Rembrandt, who wished to give him a classical education; but he had no taste for Latin, so he went to learn painting in the studio of Van Swanebruch, probably in his twelfth or thirteenth year. Orlers says that he worked with Van Swanebruch three years. This master name of a good family, and had visited Italy. Rembrandt's next master was Pieter Lastman, but he stayed with Lastman only six months. He probably returned to his father's house about 1623, and stayed there till 1630. Already he had begun to paint old age; there are several pictures of that date representing old people, as well as careful studies. He began his career as an etcher very early, and worked on the famous Vanvoorne and Mercury heads, including his own, also a fine biblical subject, 'Jesus presented in the Temple.' There are no less than thirty etchings for the year 1630, when the artist was only twenty-three. In the same year he migrated from Leyden to Amsterdam, then a picture-export of 100,000 florins, and there he set up a studio and took pupils. Already one of the most industrious and productive artists that ever lived, Rembrandt found time to paint several biblical subjects, besides a number of portraits, and to etch forty plates in the year 1631, whilst his price was raised by a rapid rise in prices. He painted one of his most important masterpieces, 'The Anatomical Lesson,' in 1632, at the early age of twenty-five. He married Saskia van Uylenburgh in June 1634. She was of a good family, twenty-one years old, and the youngest of nine children. The pair resided in a house of twenty rooms on the Herengracht in Amsterdam. There is good evidence that the marriage was happy, and we know Saskia by the portraits her husband made of her. After marriage he continued to be very industrious, even the year of marriage having a harvest of several religious pictures, and many etchings and fifteen etchings. The artist was also in the habit of producing many sketches and drawings. Vosmaer observes that these are either studies from nature or notes taken rapidly, or else embryos of ideas caught as they formed themselves, with a rude pen and a wash, or a few strokes of black stone.

Rembrandt had a daughter, Cornelia, born in July 1638, but she died the month following. A second Cornelia was born in 1640, who also died young, and a son, Titus, in 1641. His father died about 1632, and his mother about 1640, after having been frequently portrayed by her son both in painting and etching. Saskia died prematurely in 1642, after only eight years of marriage. Between the death of his mother and that of his wife, Rembrandt's activity developed itself in the direction of large canvases, portrait, small biblical or genre pictures, and large canvases with figures the size of life. The year of Saskia's death is also that of the famous picture known as the 'Night Watch.' An important branch of Rembrandt's artistic production from 1643 to 1650 was etching, which he continued to practise more or less till 1650, both in etching and painting. After the death of Saskia the domestic life of the artist becomes obscure. In 1654 his servant Hendrickje Stoffels had a child by him baptised as Cornelia, and after her death one Catharina van Vlijck is mentioned in the register as his widow, but it is unknown whether she was a second or a third wife, and at what date her marriage took place. It is not precisely known what were the causes of Rembrandt's bankruptcy in 1656. He was an ardent collector, willing to give high prices, and as his family fell into embarrassed circumstances, it is likely that he helped them. His art, too, became unfashionable; but he did not relax his diligence. His collection fetched only 5000 florins at the sale. Vosmaer believes, however, that he had found evidence of a return to partial prosperity, and that Rembrandt was able at least to rent a commodious and handsome house near the Rozengracht. After continuing to work with constant energy and undiminished power, he died October 3, 1669, following his son Titus, who died a year earlier. Titus left a posthumous
daughter, Titia, and Rembrandt was present at the baptism. He was spared the pain of losing three of his children within ten days of each other. Rembrandt left two children, names unknown.

The genius of Rembrandt has been the subject of much controversy, but his fame has increased, notwithstanding unintelligent censure and praise often equated to his name. Rembrandt's work is not limited to the merits of Italian art, as we know by his collection, but his own practice was founded on the direct study of nature. He saw around him both in human life and landscape. It is a mistake, however, to suppose that he copied marvulously, that he was and must remain classed. Far from this, he was so imaginative that he transmuted everything. He had an equal power of expressing mass and rendering detail both in painting and etching. His technical force in both arts has only been rivaled in other styles, and it has never been surpassed. The conception of Rembrandt for his chiaroscuro is, however, misplaced. The chiaroscuro of Rembrandt is often false and inconsistent, and, in fact, he relied largely on public ignorance. But though arbitrary it is always conducive to his purpose, the effect is heightened by an intentionally unequal distribution of finish. No artist ever combined more delicate skill with more energy and power. His treatment of mankind is full of human sympathy for all ages and conditions, but his especial study was old age. In his interpretation of these pictures he did not seek to give dignity by factitious magnificence or by elevating personages above their social rank, but by inspiring respect for them, and interest in them, as they were. At the same time his artistic faculty of idealisation acted in its own way by giving the pictures of Rembrandt a divine beauty, he is not the most perfect, but he is the most interesting, and his work is full of variety, both in subject and in technical methods. He was a great draughtsman, in his own way, and often a line colourist, as well as a great executice virtuoso both in painting and etching. Rembrandt had much personal influence as a teacher, and many of his pupils became known. His life seems to have been absorbed in work, and he avoided fashionable society, keeping to the burghers and artists.

See the elaborate French Life by his countryman Voasmer (Paris, 1877), the interesting study by Emile Michel (trans. ed. by Wedmore, 1893), and the monograph on the etchings by Ruysch (The Hague, 1876). Of Rembrandt's etchings, the first catalogue of the etchings of Rembrandt is the incomplete one by Gersaint, published after his death in 1751. Peter Yver of Amsterdam supplemented this, and Daniel of Liverpool published a translation in 1786. Adam Bartsch followed at Vienna in 1797. De Graeff published in 1824 an edition of preceding catalogues. Wilson (Lond. 1836) issued a new catalogue with original observations. That by Charles Blanc, in two vols. (Paris, n.d.), includes both pictures and etchings, that by Mr. Middleton (Lond. 1878) gives the etchings only, and a catalogue privately printed for the Burlington Club. In 1877 gave the etchings in chronological order. Voesmer gives the catalogues at the end of his biography, both chronological and classified. Mr. F. S. Hadden's monograph on the etchings (Lond. 1879) proves that some of the plates attributed to Rembrandt were executed by other hands, and that many existing catalogues of Rembrandt's works give about 500 pictures, 600 drawings and studies, and 350 etchings. The bent of his mind may be judged of by the choice of subject. Out of the 1,427 engravings, 495 are from the Old Testament, 255 from the New, 22 from classical mythology, and only 12 from history. There are about 440 portraits and 100 landscapes, besides some sketches of studies and letter-headings. With the single exception of the Bible, Rembrandt got little from books, and his house, so rich in works of graphic art, contained barely twenty volumes.

Remijia, a genus of Cinchonaceae (see Cinchona), valuable as a source of Quinine (q.v.). There are no known species found in Brazil. The name comes from that of the Brazilian physician Remijio.

Remington, Philo, inventor, was born at Litchfield in New York on 31st October 1816. He entered the small-arms factory of his father, and for twenty-five years superintended the mechanical departement of the Remington breech-loading rifles and of the Remington typewriter. This invention was largely due to his inventive skill. He retired in 1886, and died on 4th April 1889.

Remiremont, a town of France (dept. Vosges), stands on the Moselle, 17 miles by rail SE. of Epinal. The remains of an abbey, founded in 620, are the finest building in the town. The abbess was a princess of the empire down to 1566; the nunnery was suppressed at the Revolution. Muslin, cotton, leather factories, and sawmills exist here. Pop. 8447.

Remittent Fever is one of the varieties of fever arising from malaria or marsh-poison—one being intermittent Fever, or Ague (q.v.). It is more bilious and its milder varieties are known as delayed intermittent fever; while in its more serious form it may approximate closely to yellow fever. As the nature of the poison on which it depends is sufficiently noticed in the article Malaria, we shall at once proceed to describe the most characteristic symptoms. The attack may be either sudden or developed by languid insidious febrility, together with a general feeling of malaise. Then comes a cold stage, usually of short duration. This is followed by a hot stage, in which the symptoms are commonly far more intense than those exhibited in the other forms. Coldness preceding the delirium is not uncommon, and is a bad symptom; while in other cases drowsiness or lethargy is one of the most marked symptoms. There is often great tenderness or pain in the region of the stomach, and vomiting—the vomited matter frequently containing bile or blood. A remission of these symptoms occurs, in mild cases, in six or seven hours; but in severe cases the paroxysm may continue for twenty-four hours or longer. The remission is sometimes, but not always, accompanied with sweating. The duration of the remission is considered as that of the paroxysm, varying from two or three to thirty hours, or even longer. The fever then returns with increased severity, and without any cold stage; and then the paroxysms and remissions proceed, most commonly according to no recognisable law, till the case terminates either fatally or in convalescence. In favourable cases convalescence is usually established in about a week. The severer forms of this fever are often accompanied with more or less jaundice, and hence the disease has received the name of bilious remittent fever. It is also known under the name of jungle-fever (q.v.). Its prevalence is on the border of the great American lakes; and the African, Bengal, Levant, Welcheren, and other similar local fevers are merely synonyms of this disease. In England the disease is very rare; and when it occurs it is usually mild. The disease is most severe, and lasts longest, in the Western Indies, Central America, and the West Indies. The first object of treatment is to reduce the circulation during the hot stage. This is done by a douse of grains each of calomel and James's powder, and, after an interval of three or four hours, by a douse of calomel, followed by a draught of the ordinary black draught. On the morning of the following day the remission will probably be more complete, when quinine should be freely and repeatedly administered. A mixture of antimonial
wine with acetate of potash should also be given every two or three hours, so as to increase the action of the skin and kidneys. The patient must be carefully watched during the period of convalescence. A timely removal from all malarious influence, by a change of climate or a sea-voyage, is of the highest importance.

Remonstrance. The, a detailed statement of all the king's illegal and oppressive acts, and a vindication of the rights of parliament, laid before the House of Commons by Pym, and carried by 159 votes to 148, after a stormy debate lasting from noon till after midnight, November 22 and 23, 1641. On the question as to its being printed the debate began anew with such extraordinary exasperation that an actual conflict on the floor of the House was saved only by the calmness and tact of Hampden. On a division a majority of 23 left the publication free and restrained the printing only until further order. The adoption of the Remonstrance was felt on both sides to be a crisis in the struggle between Charles I. and the parliament. It kindled fresh the enthusiasm of the country, and hurled the king into more violent and fatal measures. 'The turning-point of freedom or despotism,' says Forster, 'for two more centuries in England was probably passed that night.'

Remonstrants. See ARMINIUS (JACOBUS).

Remora, or SUCKING-FISH (Echeneis), a genus of fishes sometimes classified not far from mackerels among the Acanthopterygii Teleostei, or referred to a special sub-order Discocoelphi. The great peculiarity is the suctorial disc on the dorsal surface of the head. It is formed from a modification of the first dorsal fin, whose spines have become eft. The sucking-fishes fix themselves very firmly to sharks, sword-fish, turtles, and even to ships. So firmly do they adhere that they are sometimes used in fishing. A line is fixed to the tail; the fish is set free; it discovers a turtle or fish and fastens itself. The fishermen dive after the line if the remora has fastened on to a turtle, or may in other cases simply haul it up. Columbus, or one of his companions, described how the 'Gunaic' shoots 'like an Arrow out of a Bowe towards the other fish, and then, gathering the bag on his head like a purse-net, hold them so fast that he lets not loose till hal'd up out of the water.' More precise details have been furnished by other travellers. Several species of Echeneis or remora are known from the Mediterranean and the Indian Ocean. The remora of the Mediterranean was well known to the ancients, and was credited with many feats, such as that of detaining Antony's ship from the battle of Actium. The fish is palatable, and is sometimes eaten after its day's work of fishing.

Removal of Goods. See LANDLORD AND TENANT.

Remseheid, a town of Rheinish Prussia, 6 miles S. of Elberfeld-Barmen, carries on extensive manufactures of woollens. Pop. (1781) 22,017; (1800) 30,029; (1890) 40,371.

Remusat, (Jean Pierre) Abel, Chinese scholar, was born at Paris, 5th September 1788, studied medicine, and took his diploma in 1813; but as early as 1811 he had published an essay on Chinese literature. In 1813 he was compelled to serve as a surgeon, but in 1814 he was made professor of China in the Collège de France. Of the numerous works that he wrote subsequent to this period we may mention Recherches sur les Langues Tartares (1820), a work in some sort preparatory to his great Éléments de la Grammaire Chinoise (1822). He wrote also on the origin of Chinese writing (1827), on Chinese medicine, on the topography and history of the Chinese empire, and Mélanges (published in 1843). Remusat was the first to make known in Europe the life and opinions of Iou-Tsze. In 1818 Remusat became one of the editors of the Journal des Savants; in 1822 he founded the Société Asiatique de Paris; and in 1824 he was appointed curator of the Oriental Department in the Bibliothèque Royale. He died of cholera at Paris, 31st June 1832, at the early age of forty-four.

Remusat, Charles (François Marie), Comte de, French politician and littérateur, born at Paris, 14th March 1797, the son of Augustin Laurent, Comte de Remusat (1762-1823), who was successively chamberlain to Napoleon and a prefect under the Restoration. His mother (née Claire Elizabeth Jeanne Gravier de Vergennes) was born in 1760, married in 1786, became dame du palais to Josephine, and died in 1821. Young Remusat early developed Liberal ideas, and took eagerly to journalism. He signed the journalists' famous protest against the Ordinances of Polignac which brought about the July revolution, and was in October elected deputy for Toulouse. He now allied himself with the Doctrinaire party, and in 1836 became under-secretary of state for the interior. In 1840, when the government passed into the hands of Thiers, Remusat was made minister of the Interior and signed the resignation of Thiers on the annexation of Lombardy. Exiled after the coup d'état of Louis Napoleon, and henceforward devoted himself to literary and philosophical studies, till, in August 1871, M. Thiers called him to hold the portfolio of Foreign Affairs, which he retained until 1873. He died June 6, 1875. Remusat was a long well-known contributor to the Revue des Deux Mondes.

Among his writings are his Essai de Philosopbie (1842); Ablard (1845); L'Angleterre au XVIII Siècle (1856); studies on St Anselm (1853), Bacon (1857), Channing (1857), John Wesley (1870), Lord Herbert of Cherbury (1874); Histoire de la Philosophie en Angleterre de Bacon à Locke (1875); and posthumously two philosophical dramas, Ablard et La Saint Bertélemy (1878), and Correspondance pendant les premières années de la Restauration (6 vols. 1883-97).

His mother's Mémoires (3 vols. 1879-80) and Lettres (2 vols. 1881), both of which have been translated into English, prove him to be of the greatest interest, and throw a flood of light on the strange society of the First Empire and the character of Napoleon.

Remy, St (Lat. Remigius). See RHEIMS.

Renaissance is a comprehensive name for the great intellectual movement which marks the transition from the middle ages to the modern world; a combination of new thought, included a change in attitude of mind and ideal of life, as well as in philosophy, art, literary criticism, political and religious thought. Substantially a revolt against the barrenness and dogmatism of Medecvalism, the new spirit claimed the entire liberation of reason, and, passionately recognising and studying
the rich humanity of Greece and Rome, aimed at a complete rehabilitation of the human spirit within the frame of studies and arts and graces which invested the classical age. It was an escape—at first hesitating, then triumphant—from a life regulated and confined on all sides by ecclesiastical tradition and intellectual tyranny into joyous freedom and unfettered spontaneity. Zeal for the Renaissance—yet the word is out of place—brought a new ideal of culture, and the new view of life for which the name of Humanism (q.v.) is used. Renaissance, re-birth, was originally used as synonymous with the Revival of Letters, the revived study in a new spirit of the classical languages and literature, and the studies of Greece and Rome in all their depth and breadth, interpreted in their own spirit, and divorced of the narrow traditional limitations. Greek in especial was practically a new discovery, and a vastly important one; but the knowledge of the classics was only one side of the movement which permeated all, transformed philosophy, science, art, and religion. The new spirit powerfully aided in weakening the power of the papacy, in the establishment of Protestantism and the right of free inquiry. Under its impulse astronomy was opened up to the public by Copernicus, and science started on its modern unfettered career; by it, too, feudalism was abolished, and the demand for political liberty began to be raised. Reverence for the Holy Roman Empire and for its ancient rival the papacy was alike decaying; a new sense of nationality was springing up, and national languages began to flourish. To the same general impulse, as causes or effects, belonged also the invention of printing and multiplication of books, new methods of paper-making, the use of the mariner's compass, the discovery of America, and the exploration of the Indian Sea. The fall of the Eastern Empire in 1453 sent swarms of Greek scholars to promote the revival of scholarship already in progress in western Europe. From the nature of the case, it is impossible to fix a definite date for the beginning of the Renaissance; long before the close of the Dark Ages there were isolated scholars and thinkers who anticipated the new light. In its main elements, however, the movement originated in Italy towards the end of the 14th century, and, acquiring its full development there in the earlier half of the 16th, the Renaissance was propagated by itself throughout the rest of Europe: France, Germany, England, and other countries participating later in the movement, which in each of them took a somewhat different shape. But Italy was specially the nursing-mother of the Renaissance.

For the first herald of the Renaissance we may go as far back as Dante (1265-1321), who, with all his mediavelism of conception, yet by the pristine energy and fullness of his poetry was no unworthy follower of his chosen master, Virgil. The first positive impulse, however, in that direction was imparted by Petrarch (1304-74) by his opening the Latin epistolarum of Cicero, and thus suggesting to his Italian friend the old Roman grace, he awoke enthusiasm for the classics by his Latin epic Africa, and numerous epistles and dissertations. In his old age he tried to imitate a little Greek at the extremely sorry sources within his reach, writing his Historia de Vita et Gesta Christiani Rerum, urging Boccaccio to translate the sacred poet into Latin. Boccaccio did not rest till he had piously, though very imperfectly, rendered into Latin both the Iliad and Odyssey. A secretary of Petrarch, Giovanni Malapagno, commonly called da Ravenna, was the first to compose in Italian. In the course of his duties and, wandering as he did all over Italy, communicated the new impulse to distinguished pupils, Barbaro, Strozzi, Poggio, Bruni, who in their turn propagated it anew from Venice, Rome, Mantua, and elsewhere. Luigi Marsigli's house became a private casualty to the revival of all graces and utilities among the young and promising neophytes of Florence. Calzecico de Saintato, who translated Dante into Latin, having been made chancellor of Florence in 1375, introduced into public documents the stately sonorous periods of the classic style, and so rendered it imperative on all princes and gentlefolk of the next age to have trained stylists as their secretaries. A like classic transformation was effected in episodal correspondence by Gasparino da Barzizza, who made a special study of Cicero's letters. The glory of having been the first Florentine to visit Bologna and Paris and to have lived under the sacred Greek belongs to Giano di Scopatia. To Salutato and Pallotto di Strozzi is due the foundation of a Greek chair at Florence; and in 1396 Manuel Chrysoloras, a genuine Greek in the flesh, began his instructions from the Greek chair. Chrysoloras planted schools also at Rome, Padua, Milan, and Venice. In the earlier period of the Renaissance Florence leads the van. The president of the republic, Cosimo de' Medici, himself a scholar, theologian, philosopher, musician, financier, a connoisseur in painting, sculpture, and music, and himself a great patron of the arts, was one of the founders of the Accademia of the Del Medici. Among the most eminent of the scholars of his time, rescued Quintilian from a 'foul prison' and transcribed him, and copied with his own hand MSS. of Lucretius and Columella, while he also unearthed Italiens, Manilius, and Vitruvius. Though for fifty years chanseller in the Roman Curia, he directed the most poignant satires against the church. Vespassiano da Bisticci (1421-98) was probably the last of the mediavel scribes, and the first of modern booksellers; he was agent of Cosimo, Nicholus V., and Federick of Urbino, supplier of all the books of the Curia, of the University of Paris, and of all Italy, and the largest employer of copyists in Europe, whom, too, he personally superintended.

The second period in the history of the Renaissance is distinguished by indiscriminate avilility for everything classic. As its most representative scholar may be cited Francesco Fileippo (1398-1481). Having studied rhetoric and Latin at Padua, he learned Greek at Constantinople, became professor at Venice, Bologna, and Florence, and gained the admiration of all Italy for erudition. In the third period of the fifteenth century came the fame of Lorenzo de' Medici and Politian at Florence, Boiardo at Ferrara, and Sannazzaro at Naples. President of Florence from 1469, and himself of the most versatile talent, Lorenzo de' Medici was, like his grandfather Cosimo, his son Giovanni (Leo X.), and his nephew, Pope Leo X., a constant promoter of all learning. By the consent of all, the most consummate of the humanists is Politian, whose Manto, Ambra, and Nutritia display almost as spontaneously a command of the classic languages as do his Orfeo, Storze, and Rime of his native Italian. A last and, possibly, the briefest stage of erudition began to sink in credit, and the accomplished personages who adorn the fourth period are of a somewhat more independent type—the historians, Giuicciardini and Machiaveli,
the handsome Bembo, the splendid Alberti, Castiglione, the author of Il Cortegiano, and Ariosto, author of Orlando Furioso, the Cinque Canti, and the polished cynical Satires.

Some of the faults of the Renaissance clung to it in all its periods. At one time pelatry threatened to check originality and spontaneity; the worst ancient works were prized more than the best written in any new European tongue. Petrarch valued himself mainly for his Latin works, and thought lightly of his Italian poems. The tendency was established to regard the classics as the one standard of learning and the one instrument of education. A worse fault was that the revolt against medieval religious tradition was accompanied to a very large extent by absolute and anti-Christian immorality and license. Literary and artistic refinement placed no check on brutal lusts and savage passions; though in a few men of high character, Michelangelo, Raphael, Iwo, Miranda, Marsilio Ficino, and others, in whom Humanism did not extinguish the principles of Christianity and morals, a singularly noble and complete humanity was displayed. The culmination of the Renaissance in Italy may be regarded as having fallen within the half century 1456–1506; and its close for the land of its birth may be fixed at the sack of Rome in 1527 by the Constable de Bourbon, followed by the transference of Humanism in its later developments to France, England, and the rest of Europe.

In Germany the change was as marked as in Italy, but the Humanism of Germany and the Low Countries was very different in spirit from that of Italy. Not less tinged by a revived love for ancient learning, it was never divorced from morality and hostile to Christianity; and its most important direct outcome was the Reformation. Biblical and Oriental studies were strenuously cultivated. Amongst the noted leaders were Erasmus, Melanchthon, Rerchlin, and Von Hutten. In the Netherlands and Flanders the new school of painting was a notable development. In France the new delta and rich results in art and letters. Villon, Marot, Ronsard, but above all Rabelais are types of the French Renaissance in pure literature; while within the sphere of scholarship and religious reform we have here the names of the Scaligers, Dolet, Muretus, Cujacius, Salmuis, Cassanbon, Beza, Calvin.

In England Wyelof and Chancce may be regarded as the forerunners of the Reformation and the Renaissance; but the main streams of both these movements reached England contemporaneously. In scholarship the great names are Groecyn, Linacre, Colet, Ascham, and More; but the fullest English outcome of the Renaissance was the glorious Elizabethan literature, with Spenser and Shakespeare, and in philosophy Bacon, as its most noted representative.

RENAISSANCE, in Architecture, the style which succeeded the Gothic, and preceded the rigid classicism of the classic revival in the first half of the 19th century. Under the heading ITALIAN ARCHITECTURE we have traced the rise and progress of the Renaissance; for this was an epoch of its birth. The spread of classical literature during the 15th and 16th centuries created a taste for classic architecture in every country in Europe. France, from her proximity and constant intercourse with Italy, was the first to introduce the new style north of the Alps. Francis I. invited Italian artists to his court during the first half of the 16th century. The most distinguished of these were Leonardo da Vinci, Benvenuto Cellini, Primaticcio, and Serlio. These artists introduced Italian details, and native architects applied them to the old forms to which they were accustomed, and which suited the purposes of their buildings, and thus originated a style similar to, though diverse from, that of Italy.

The Italian buildings, besides many palaces and domestic structures, comprised a large number of churches. St. Peter's being the great model. In France (as in the other countries north of the Alps) the stock of churches was greater than was required. The grand domestic buildings of Florence and Rome were constructed for defence externally, and were founded in design on the old medieval castles, which the nobles occupied within the cities. The domestic architecture of France is rather taken from the luxurious residences of the monks, and the pleasant open villas in the country; so that, although very graceful in outline and in detail, its buildings want the force and grandeur of the Italian palaces.

In the French Renaissance so much are the old Gothic forms and outline preserved that the buildings of Francis I. might at a short distance be mistaken for Gothic designs, although on nearer approach all the details are found to be imitated from the classic. Such are the palaces of Chambord (q.v.)

and Chenonceaux (q.v.) on the Loire, Fontainebleau, and many others. The churches of this period are the same in their principles of design. Gothic forms and construction are everywhere preserved, while the details are as nearly classic as the designers could make them. St. Eustache, in Paris, is one of the finest examples of this transitional style.

From the middle of the 16th to the middle of the 17th century a style prevailed which may be said to exhibit all the varieties of the Renaissance. This style, usually known as that of the time of Henry IV., may be distinguished by the constant use of pilasters, broken entablatures, curved and contorted cornices, arched arches, &,c., all applied so as to conceal rather than to mark and dignify the real uses of the features of the buildings. The Tuileries, wrecked by the Commune, showed all these defects.
Many of the features of this period are imitated in the so-called 'Queen Anne style' of the present time (see below). From this debased style architecture gradually recovered, and during the 18th century a style more becoming the dignity and importance of the Grand Monarque was introduced. The classic element now began to prevail, to the entire exclusion of all trace of the old Gothic forms. Many very large palaces are built in this style; but, although grand from their size, and striking from their richness and luxury, they are frequently tame and uninteresting as works of art. The palace of Versailles (q.v.) is the most

instance, a pure peripteral temple is taken as the object to be reproduced, and the architect has then, as in many instances, produced a style called Jacobean, of which Heriot's Hospital at Edinburgh is a good example; the fantastic ornaments, broken entablatures, &c., over the windows, being characteristic of this style, as they were of that of Henry IV. in France.

The first architect who introduced real Italian feeling into the Renaissance of England was Inigo Jones. After studying abroad he was appointed superintendent of royal buildings under James I., for whom he designed a magnificent palace at Whitehall. Of this only one small portion was executed (see Whitehall), which still bears the name of the Banqueting House, and is a good example of the Italian style. Jones also erected several elegant mansions in this style, which then
became more generally adopted. In the later half of the 17th century a splendid opportunity occurred for the employment of the Renaissance style after the great fire of London. Sir Christopher Wren rebuilt an immense number of churches in that style, of which St. Paul's (q.v.) was the most important. The spire of Bow Church and the interior of St. Stephen's, Wallbrook, are also much admired.

During the 18th century classic feeling predominated, and gradually extended to all classes of buildings. In the early part of the century Vanbrugh built the grand but ponderous palaces of Blenheim and Castle Howard, which have a character and originality of their own. To these of them, or to look like such, and then the architect had to work out the accommodation as best he might. St. Pancras' Church in London is a good example. It is made up of portions from nearly every temple in Greece! Many really successful buildings, however, have been designed under the guiding hand of Renaissance—viz., one in which the classic elements are subordinated to the Gothic disposition, and which is now generally understood by the expression 'Classic.'

Sir Charles Barry was the first to break away from this thrall and, to return to the true system of designing buildings—namely, by so arranging their general features as not only to express the purposes they are intended to serve, but in so doing to form the decorative as well as the useful elements of the edifice. The Travellers' Club-house and Bridgewater House in London are admirable specimens of his design. There are no superfuluous porticoes or obstructive pediments, but a pleasing and reasonable design is produced by simply grouping the windows, and crowning the building with an appropriate cornice.

As already noticed, a similar style of domestic architecture is now being worked out in France; but both there and in England there was a reaction against everything classic, and a revival of medieval architecture superseded that of classic, especially in ecclesiastical buildings. The most magnificent examples of this style are the Palace or Houses of Parliament at Westminster, and the new Law Courts.

The so-called Queen Anne style, common in recent years, is supposed to be founded on the class of design prevalent at the beginning of the 18th century. The buildings erected at that period were of a very plain and simple order, with classic cornices and details, and frequently with large windows, sometimes divided by mullions. There is occasionally a certain picturesqueness in the arrangements which has been made the most of in the modern revived style. The latter, although taking the name of Queen Anne, is far from adhering to the style of her reign, but rather a free use of the elements of the early Renaissance or Elizabethan style. It thus combines much of the freedom of the late Gothic with classic detail, to which is added a copious use of features borrowed from the Renaissance of France and Germany. Many large structures have been erected in this style, such as the Royal Colonial Institute at London, and the new Law Courts at Birmingham. In these buildings the peculiar features of the style are visible—viz., large windows, divided by plain mullions, and a mixture of classic details and Gothic forms. The style adapts itself well to villas and smaller structures, in which the curved gables of the dormers form prominent features.

In Germany, Russia, and every country of Europe the Renaissance came to prevail in a manner similar to that above described in other countries. The picturesque castle of Heidelberg is an early example, and the Zwinger and Japanese palace at Dresden are edifices of the beginning of the 18th century. In the domestic buildings of Nuremberg,
Dresden, and other towns of the north of Germany, many instances occur of the picturesque application of classic detail to the old Gothic outlines. One of the most striking examples of Gothic and classic architecture is that of the cathedral of St. Mark's at Venice, which was begun in the Byzantine Chapel Royal; and the Walhalla, on the banks of the Danube, is an exact copy (externally) of the Parthenon. The finest buildings of Munich are the Picture-gallery and Sculpture-gallery by Klenze, both well adapted to their purpose. The Wood of Italian and Grecian architecture. In Vienna and Berlin there are many examples of the revived Classic and Gothic styles, but the Germans have always understood the former better than the latter. The museums at Berlin, and many of the theatres of Germany, are good examples of classical buildings. The domestic architecture of Berlin is well worthy of notice, many of the dwelling-houses being quite equal in design to those of Paris. Of the other countries of Europe the only one which deserves remark for its Renaissance buildings is Russia. St. Petersburg, as yet, is all that Europe, the one which best merits the title of a city of palaces. From the date at which the city was founded, these are necessarily all Renaissance in character. They are nearly all the works of German or Italian architects, and are unfortunately, for the most part, stunted and widthless. The ornaments of the palaces are chiefly pilasters running through two stories, with broken entablatures, &c., and ornaments of the finest rococo. The New Museum, by Klenze, is, however, a marked exception. In America nearly all the new buildings, of importance, are carried out in the Renaissance style. Many of these are of great size and striking design. The town-hall of Boston may be referred to as one of the most imposing and effective. Another conspicuous example is the new city hall of Philadelphia (q.v.) which was during the period of the Renaissance Painting and Sculpture and all the other arts took their models from the classic remains which were so carefully sought for and studied. All ornamental work, such as carving, jewellery, and metal-work of every kind, follows in the mode. Medieval niches and pinnacles gave place to the columns and entablatures of the classic styles, and the saints of the middle ages yielded to the gods and goddesses of ancient Rome. See Burekhardt, The Renaissance in Italy (Eng. trans. 1875; 2nd ed. 1890); Dater, The Renaissance (1875; new ed. 1888); Michelet's Histoire de France, tome ix.; John Owen's works on the sects of the Renaissance; Symonds, The Renaissance in Italy (5 vols. 1873-86); W. Anderson (1866); Münz, Histoire de l'Art pendant la Renaissance (1886); books on Renaissance Architecture in England by Gotch and Brown (1862 & sep.); and Blomfield's Art and Industry of Ancient and Modern Architecture, Italian Architecture, and works there cited: as also those on Ariosto, Boccaccio, Bruno, Campiello, Francesc, Huten, Machiavelli, Medici, Petrarch, Politian, Raphael, Raphaeli, Savonarola, &c.

RENAN, Ernest, was born at the little town of Tréguier, in the department of Côtes-du-Nord (Brittany), on the 27th February 1823. In his Souvenirs d'Enfance he has sought to mark the various influences that wrought in him during his childhood and early youth. He was a Breton Celt by his father's ancestry, a Gascon by his mother's; and all his critics have agreed with himself in recognizing in his moral and mental habits the blended characteristics of this double descent. The centre of the life of Tréguier (originally a monastic village) is its minister, and to this atmosphere of the great religious orders he was early brought to these studies which he unceasingly pursued for more than half a century. His father, who was a sailor, died while Ernest was still a child, leaving his widow in straitened circumstances, with the care of one daughter and two sons. To his mother and sister Renan owed a special debt which he has expressly acknowledged in his Memorials of his childhood. It further deepened the religious influences of his native village that he remained there till his sixteenth year as a pupil in its school. All his teachers were priests, and considered them as men of primitive piety and simplicity, but wholly unacquainted with the movement of things outside their own parish. The education they gave was that which had been the tradition in the church for the preceding two centuries. They taught Latin in the old fashion, but above all they taught to turn out good men.

The young Renan gave early promise of his future distinction, and in 1836 he was one of the boys chosen by the Abbé Dupanloup for a place in the Catholic seminary of St. Sulpice, at Paris, conducted by himself on methods entirely his own. The feelings of the boy on this change from the simple life of his Breton village were what might be those of a Mussulman fakir suddenly transported into a crowded boudoir. The one aim of the Abbé Dupanloup in training of the boys under his care was to turn out priests with the accomplishments and temper of mind that would render them effective men of the world, able to serve the church in spheres where her interests could best be furthered. Dupanloup was respected and beloved, but his system, according to his most distinguished followers, whom he afterwards came to regard as a viper he had nursed in his bosom, his system was 'too little rational and too little scientifical.' The boy had from the first been destined for the church, and he proceeded regularly along the course it prescribed. After three years the 'rhetoric' at St. Nicolas du Chardonnet he was entered as a student of St. Sulpice, the great seminary of the diocese of Paris. But before entering that seminary itself and beginning his theological preparation he had to complete two years' course of studies in the university. His next two years, therefore, were spent at Issy near Paris, in the study of such philosophical teachers as the church had approved of and entitled to its approval. Descartes adapted to Catholic orthodoxy, and the 'doctrina' of Bossuet, were the main subjects of study. At the conclusion of his course at Issy he was in all things, personal habits and temper of thought, a docile son of the church; though one of his teachers had already divined the essential tendency of his mind, and had plainly forewarned him that he was not a Christian. But it was at this last stage of his novitiate that was to show what direction he was eventually to take. At St. Sulpice his attention
was mainly turned to the study of Hebrew, and to this study, of his own accord, he added that of German. As the result of these combined studies (for Renan is careful to state that his questionings first came to him from historical and philosophical, and not from metaphysical considerations) the traditional construction of Christianity had begun to crumble. In 1861, Smith and Thirlwall, in their Origin of the Christian Religion and Theology. Among works of its kind it stands alone in literary value, though it is not the only one of its kind. And in 1881 he published his Histoire des origines du christianisme. In 1885, he was appointed professor of the French Academy. Renan married a niece of the famous painter Ary Scheffer. Of the long series of Renan's works, which by their combined learning and literary power made him the first man of letters in Europe, we can here note only those which call for special mention in a summary account of his career. His work as an author began with a paper Sur les langues sémitiques (1847), afterwards developed into his Histoire générale des langues sémitiques (1851). Checked and supplemented as it has been by subsequent scholars, this treatise is still regarded by specialists as having made an epoch in the history of Oriental studies. In his Averroès et l'Averroïsme (1852) he gave one proof among many others of his familiarity with the life and thought of the middle ages. In addition to these and other works dealing at length with special themes he wrote frequent essays, afterwards collected in his Études d'histoire religieuse (1856) and Essais de morale et de critique (1850), which arrested wide attention by their grace of style and originality of suggestion. His European reputation, however, dates only from the publication in 1863 of the Vie de Jésus, which one of his most discerning critics has described as 'one of the events of the century.' With the Vie de Jésus also began what its author regarded as the special work of his life, the Histoire des origines du christianisme. In Renan's conception of the historicism of Christianity, in the true sense of the term, is possible only from the close of the 20th century after Christ. Previous to that period materials do not exist for an adequate narrative based on data that justify a dogmatic construction of the development of Christianity. The tracing of the Christian origins, therefore, must be a work essentially tentative, and one that, justifying con-
RENDSBURG

RENFREWSHIRE

in which they exercised their function as general critics and scholars, he suggests an interesting and evident parallel. Both gave their best years to the work of expounding Christianity; the one vies with the other in the long series of volumes which make the record of their life's labours; the other shrinks from the task of defining his contemporaries; both living in an age of religious revolution were accused by extemne men of undue concession to traditional opinion; and in the work of both it is the element of a many-sided and elusive personality that distinguishes it from the older and more complete. Dated October 2, 1892.

Renan's Histoire des Origines du christianisme consists of the following volumes: Vie de Jesus (1853), Les Apotres (1856), Saint Paul (1867), L'Antechrist (1873), Les Evangiles et la seconde Vibration chrétienne (1874), L'Eglise chrétienne (1877), Marc-Aurèle et la Fin du Monde antique (1880), Index général (1883); the great complement, Histoire du peuple d'Israel (5 vols., 1887-91). Other writings are: La Littérature (1858); Le Livre de Job (1889); Le Cantique des Cantiques (1890); L'Ecclesiastique (1892); Histoire Générale des langues sémitiques (1854); Mission de Phenicie (1863-74); Ethnétique (1872); Nouvelles Études d'Histoire Religieuse (1884); Aventures et d'Avènement (1832); Essais de Morale et de Critique (1859); Mélanges d'Histoire et de voyages (1878); Questions contemporaines (1859); La France Intellecutuelle et Morale (1871); De l'Église (1849); Littérature contemporaine (1876); Drame philosophiques, including Cædian, L'eau de Jeune, Le Prince de Nezi, L'Abbesse de Jouarre (1889); Souvenirs d'Enfance et de Jeunesse (1895); Discours de la Sorbonne (1888); et dernier, the Hubert Lectures (1899) delivered in London, on The Influence of the Institutions, Thought, and Culture of Rome on Christianity; with Victor Leclercq, the Histoire littéraire de France, 18 volumes, with Charles Scheler; and Mme. Sœur Henriette (1895; trans. as Brother and Sister, 1896). For critical estimates, see Sainte-Beuve, Nouveaux Lundis (tome ii.); Scherer, Études sur la littérature contemporaine (tome viii.); G. Monod, Les Mœuvres de l'Histoire (1895). See also Grant Duff's In memoriam (1893) and Mme. Darmesteter's Life of him (1897).

Rensburg, a town of Sleswick-Holstein, stands on the Baltic Canal, 19 miles W. of Kiel, and manufactures of cotton, machinery, and chemicals. Pop. 7,721.

René L., named 'the Good,' titular king of Naples and Sicily, the son of Louis I., Duke of Anjou and Count of Provence, was born in 1499 at Angers. He failed in his efforts to make good his claim to the crown of Naples, gave his daughter in marriage to Henry VI. of England (1443), and ultimately devoted himself to Provencal poetry and agriculture at Aix in Provence, where he died and was buried in 1489. See ANJOU.

Renegade is defined as one who renounces his religious faith and adopts another creed, more particularly one who renounces Christianity and becomes a Moslem; but in a wider sense the word is practically synonymous with the word traitor—those who deserts to the enemies of his country. A few of the more notorious renegades of history may be named. Hippasus, son of Pisistratus, fought with Sparta against his country Athens, and later joined the Persians. Ommaruzzi, the editor of Homer, left Greece and became a Muslim; the same is true of those of Hippus to induce Xerxes to invade Greece. Coriolanus led the Volscian armies against his native city Rome. Julian the Apostate was of course a renegade from Christianity. The Templars were accused, amongst other things, of being virtually renegades from their faith. The Algerine pirates surnamed Barbarossa (q.v.), who in the first half of the 16th century kept the Mediterranean coasts in a state of perpetual terror, were by birth Greek Christians of Mytilene. Henry of Navarre, fourth king of that name in France, renounced the Protestant creed after he ascended the throne. During the Thirty Years' War there was a prominent renegade leader on each side: Count Mansfeld (II.) deserted the emperor and the Catholic cause because the former treated him ill; Pappenheim, the commander of the celebrated dragoons and in the service of Magdeburg, went over from the Protestants to the Roman Catholics. Archibald Campbell, seventh earl of Argyll, was in 1619 declared a rebel for having entered the service of the king of Spain, a Roman Catholic prince at war with Britain. The 'pirates' Paul Jones, who during the war of American Independence ravaged the coasts of Scotland, was by birth a Scotsman. Mazepa, the Cossack chief, fought against his sovereign at Pultowa in the army of Charles XII. of Sweden. The Duke of Riberda, who won his laurels in the service of Spain in the Thirty Years' War, is in the latter part of the 18th century, the era of the Equatorial Provinces of Africa, is a German Jew, who has become a Mohammedan. The redoubtable Osman Digna, who has occasioned so much trouble as the Mahdi's lieutenant between Nile and Red Sea, is stated to be the son of French parentage, his birthplace Rouen, his name George Nisbet (Scotch). In literature, besides plays and novels and poems dealing with persons already named, Massinger's Renegade and Byron's Siege of Corinth may be quoted as works in which renegades play important parts.

Renfrew, an ancient royal, parliamentary, and municipal burgh, the county town of Renfrewshire, stands on the south bank of the Clyde, 6 miles below Glasgow. Its charter of regality dates from 1396, but it was a burgh at least as early as the reign of David II. (1124-53). A knoll called Castlehill commemorates the site of Renfrew castle, the original seat of the royal house of Stewart. Anciently the chief port on the Clyde, it has still a small wharf, but the sea traffic is unimportant. The principal industries are shipbuilding and some extent of the Kilmannoch group of burghs, which return one member to parliament. Pop. (1841) 2013; (1851) 161,091; (1861) 263,574; (1871) 290,790. The surface is irregular; besides the low lands principality, there are hills of various sizes, those of the Clyde, the Black Cart, and the White Cart, with upland pastures and ranges of hills, the highest point being the Hill of Stake (1711 feet) on the borders of Ayrshire.

Agriculture and the breeding of horses and cattle are extensively carried on; dairying-farming is largely practised, owing to the proximity of large towns. Rather less than two-thirds of the whole extent is arable, mainly in pasture or grass crops. The minerals are coal, iron-stone, shale, and lime; copper occurs at Gourock and Lochwinnoch; and in the latter with success. Besides mining and agriculture, numerous industries flourish in various parts of the county, the principal being the manufacture of thread, cotton, and chemicals, print and bleach works, ship building, engineering, and sugar-refining. Renfrewshire is
well supplied with roads and railways, and has two considerable rivers—Greenock and Port Glasgow. It is divided for administrative purposes into two wards, Upper and Lower, with sheriff-substitutes at Paisley and Greenock. There are two parliamentary divisions, eastern and western, each returning one member. Till 1889 part of the seceded burgh of Glasgow was regained within the county. The chief towns, besides those mentioned, are Renfrew, the county town and only royal burgh, Pollokshaws, Johnstone, and Barrhead. Renfrewshire, or at least the western portion, was anciently called Strathclyde, and was the first part of the house of Argyll to be united—1404, not long after the accession of that family to the crown, the title of Baron of Renfrew (still borne by the Prince of Wales) was conferred by Robert III. on his son James; and about the same time Renfrew was disjoined from the sheriffdom of Lanark and made a separate county.

See Crawford's History of the Shire of Renfrew (1716), and Historical Collections of the County (Paisley, 1880; not completed).

Reni, a town of Bessarabia, at the confluence of the Pruth and the Danube. Pop. 6000.

Renmark, a town in South Australia, situated on the Murray, 135 miles ENE. of Adelaide, engaged in grape-growing and other fruit-culture. Pop. 500.

Rennell, JAMES, geographer, was born near Chudleigh, in Devonshire, 3d December 1742, and served first in the navy and then as an officer of engineers in the East India Company's army, rising to be major. As surveyor-general of Bengal he prepared a Chart of the Banks and Currents at the Laccadives (1778); and, having retired (1782), he wrote various works on India, including Memoirs of a Map of Hindustan (1783). In 1786 he published a Memoir of the Geography of Africa, and in 1798 he aided Mungo Park in the arrangement of his travels, illustrating them by a map. Perhaps his most famous work was his Geographical System of Herodotus Examined and Explained (1806). In 1814 appeared his Topography of the Plains of Troy, and 1826 Illustrations of the Expedition of Olympos. After his death—at London on the 29th March 1830—there were published An Investigation of the Atlantic Currents and those between the Atlantic and Indian Oceans (1832), and a Comparative Geography of Western Asia (1831). See the memoir on him by S. Clerk-Mahan (1895).

Rennes (the Conduit of the Redones), the capital formerly of the province of Britanny, and now of the department of Ille-et-Vilaine, is situated at the confluence of those two rivers, 344 miles WSW. of Paris and 51 SSE. of St Malo. A seven days' fire in 1720 destroyed nearly 4000 houses, and the ancient walls have been superseded by pleasant promenades, so that the place wears a modern aspect. Four bridges connect the upper or new town and the lower or old town, and the most noteworthy of the public buildings are the cathedral, finished in 1844, and Italian in style; Notre Dame, with its dome surmounted by a huge image of the Virgin; the archbishop's palace (1672); the stately Palais de Justice (1618–54); the university buildings (1855), with a picture-gallery; the theatre (1783); the Hôtel de Ville, with a public library and the Lyceé. As the focus of main and branch lines of railway between Paris and the north-west of France, and commanding good river and canal navigation, Rennes is favourably situated for commerce; and, in addition to its large dockyard alongside the river and the neighbouring districts, it carries on a considerable trade in its own manufactures, which include sail-cloth, table-linen, &c. Pop. (1872) 48,638; (1886) 62,482. There is a standard history by Ducres and Villeneuve.

Rennet (A. S. rennaa, renna, 'to run') consists of the inner lining of the true stomach (see Digestion) of the sucking-calf. It contains a ferment which causes milk to clot (see milk), called the milk- or rennet-ferment. The rennet is used in the manufacture of cheese, and to a less extent in the preparation of curds and whey or rennet. It is prepared by removing the stomach from the calf as soon as it has been killed, and separating off the lining membrane of the stomach. It is then salted and dried, and will keep for some time in that condition. When used, this preparation of the ferment is still quite active, is softened in water and added to the milk which is to be curdled. For many years past the milk-curdling-ferment has been obtained from rennet in the form of an extract. It is soluble in salt and water, and is extracted from the fresh rennet of the calf, and kept from putrefying by the addition of alcohol. Extracts of rennet thus prepared are extensively used, and may be had at the druggists' stores.

Rennet. See Apple.

Rennie, JOHN, civil engineer, was born at the farm of Phantassie, near East Linton, East Lothian, 7th June 1761. After being for some time a workman in the employment of Andrew Melkie, ingresar of a Tron, he attended the lectures of Robinson and Black at Edinburgh University. He visited (1784) the works of Messrs Boult and Watt at Solo, near Birmingham, and was immediately taken into employment by that eminent firm. He brought his original genius to the firm itself; and so highly did Watt esteem Rennie that he gave him, in 1789, the sole direction of the construction and fitting-up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the connecting wheel-work were so striking that Rennie at once rose into general notice, and abundance of null-work now flowed in upon him. To this branch of engineering he added, about 1798, the construction of bridges, in which his pre-eminent talent and ingenuity displayed themselves. The chief of his bridges were at the Forth Bridge near Kelson (1803), Leeds, Musselburgh, Newton-Stewart, Boston, and New Galloway, with the Waterloo Bridge over the Thames, which was commenced in 1811, and finished in less than six years, at a cost of more than £1,050,000 (see Vol. II., pp. 437–8). Another of his works is Southwark Bridge; he also drew the plan for the London Bridge, which, however, was not commenced till after his death. He superintended the execution of the Grand Western Canal in Somerset, the Pulbrook Canal in Cornwall, the canal between Arundel and Chichester, and, chief of all, the Kennet and Avon Canal between Newbury and Bath; he also drained a large tract of marsh land in the Lincoln Fens. (The Bell Rock lighthouse was almost wholly the work of Stevenson.) The London Docks, the East and West India Docks at Blackwall, the Hull Docks, the Princes Dock at Liverpool, and those of Dublin, Greenock, and Leith were all designed by him, and wholly or partially executed under his superintendence. He also planned many improvements on harbours and on the docks of Portsmouth, Chatham, Sheerness, and Plymouth; executing at the last mentioned port the most remarkable of all his naval works, the celebrated Breakwater (q.v.). He also made great improvements in the diving-bell. He died October 4, 1821, and was buried in St Paul's Cathedral. Of his works the remarkable combination in them of beauty and durability; and though they were
frequently objected to on the ground of costliness, yet in the end the housing utilities more than compensate for this. In person Rennie was of extraordinary stature and herculean strength. See Smiles's Lives of the Engineers (1874).

GEORGE RENNIE, civil engineer, and eldest son of the preceeding, was born in Surrey, January 3, 1791, educated at Edinburgh University, and commenced the practical study of engineering, under his father, in London in 1811. In 1818 he was appointed superintendent of the machinery of the Mint, and at the same time added his father in the planning and designing of several of his later works. After his father died in 1818 Rennie entered into partnership with his younger brother, John (afterwards Sir John Rennie), as engineers and machinery constructors; and during the existence of the firm it carried on an immense business, including the execution of most of the works which had been planned by the elder Rennie and the completion of those which he had left unfinished. Their operations embraced the construction of bridges, harbours, docks, shipyard and dredging machinery, steam-factories, both in Great Britain and on the Continent, and marine engines for war-ships. Their projects included the widening of the Tiber, construction of the Rhenish canal, the iron, drained large tracts of land in the midland counties of England, and superintended the construction of several continental railways. George Rennie died 30th March 1866.

His brother, SIR JOHN RENNIE, associated with him in business till 1843, was born August 30, 1794, was knighted his father's office previous to the construction of Sonthwark and Waterloo bridges, and was knighted on the completion of London Bridge, which he executed from his father's designs. He acted as engineer to the Admiralty for ten years, and, in company with his brothers, contributed to the introduction of the screw-propeller into the navy. He had a wide reputation for all subjects connected with hydraulic engineering, harbour-works, &c., and a list of his important engineering works will be found in his Autobiography (1875). He died September 3, 1874. He was author of British and Foreign Harbours (1854) and a monograph on Plymouth breakwater (1848).

Rent, in common speech, is money paid for the use of land or houses. In political economy it usually means money paid for the use of land; and it is generally taken as a reference to the processes and discussions of economists regarding rent have risen. Economists have generally held it to be the great merit of Ricardo that he elucidated the true theory of rent. Anderson, Malthus, and West had indeed enunciated it before, but the classical statement of it (fully developed in his Principles of Political Economy, 1817) came from Ricardo. According to that theory the amount of rent paid represents the excess of the price of the produce of the land over the cost of production on that land. The cost of production includes the usual wages paid to the laborers, interest on the capital invested in the cultivation of the soil, and remuneration of management. In other words, after the laborer has been paid the usual wages and the farmer has received the usual return for his capital and trouble from the produce of the land the remainder is rent.

It will be seen therefore that the amount of rent depends on the price obtained for the produce. Rising prices for agricultural produce mean rising rents. And in this, as in other departments, prices depend on the relation of demand to the supply. A country whose population is growing rapidly, and those of the rapidly growing population, and a supply that cannot nearly keep pace with it will lead to a great rise in prices. Such was the condition of England at the end of the 18th century and the beginning of the 19th, when a rapidly growing population had to depend almost solely on the home market, prices have fallen and also rents. The demand has increased, but the supply has increased vastly more, and in spite of the growing population rents have fallen. The general truth however remains that rent depends on prices, and not prices on rent, as is taught by the Ricardoian formula, which, however, is not a satisfactory expression of the fact, rent is not an element in the price of corn.

After having been much overrated as a discovery in political economy, the Ricardoian theory of rent is now in many quarters unduly depreciated. It still remains generally valid under the conditions contemplated by its exponent. Those conditions are a system of land-holding by private owners who do not cultivate their land, capitalist farmers, and free labourers; the rotation of the three classes to exclude any existence of rent. In other words, the economists who have worked out the theory have had in view England, and other countries in so far as they are similarly circumstanced as England. But even in England there are many things which greatly modify the operation of the principle—the influence of custom, the natural conservation of all classes, local attachment on the part of the farmer and labourer, &c. Very important also is the fact that many of the landlords have regard to social and political considerations, as well as to reasons of fairness and economy in the distribution of their property; and it is remembered that a disturbance in agricultural prices, such as that caused by the introduction into European markets of the enormous supplies from America, may have rendered the Ricardoian theory ludicrously inapplicable to the rents actually paid, particularly under long leases. Under these circumstances rent was often paid not out of the surplus of the farmer's profits, but out of his capital. The Ricardoian theory of rent therefore formulates a tendency which, even under the conditions contemplated, accords with facts only in a rough and general way.

When we consider economic history and the existing economic conditions of the world we may perceive how limited in scope the Ricardoian theory of rent has been. In many countries custom has decided, and still decides, the rent paid for land. In very many countries it has not been either competition or custom that has regulated rent, but the owner has wrung from the cultivator all that he could. The only limit to the extactions of the owner has been his own pleasure or caprice or the endurance of the cultivator. In countries, however, where the state is the owner of the land, rent may more correctly be regarded as a tax.

The rent paid for land occupied by towns and that paid for mines are in some important respects different from the rent of agricultural land. The rent paid for land in towns is much more directly influenced by the diminishing returns by increase of population and growth of prosperity. Immuch as the owner receives great advantages from such causes while contributing little or nothing, economists of standing maintain that such land should be under municipal ownership and control. The rent paid for minerals is generally obtained by the owner as long as the mines become exhausted, while the agricultural properties of the soil are permanent in the main. As regards rent generally, it should be repeated that economic formulas are of comparatively little
value. The main thing is a thorough knowledge of the facts and conditions, which vary continually according to the time and country with which we are concerned. For other aspects of rent, see also Land Laws, Landlord and Tenant.

**RENTON**, a burgh of Dumfriesshire, on the right bank of the Leven, 2 miles N. by W. of Dumfarten. Founded in 1752, it has a Tusean column (1774) to the memory of the novelist Smollett, who was born close by, and it carries on malico-printing, dyeing, and bleaching. Pep. (1831) 1860; (1881) 4459; (1891) 5458.

**Renwick, James**, last of the martyrs of the Covenant, was born at Moniaive, Dumfriesshire, 16th February 1662. He attended Edinburgh University with a view to the ministry, but was denied his degree, as he refused the oath of allegiance; and, after witnessing the deaths of Cargill and others of the martyrs, he resolved to embrace the cause for which they suffered. He was chosen by the 'Societies,' as the bands of men devoted to the Covenant were called, to proceed to Holland to complete his studies in 1682, was ordained at Groningen in 1683, and at once proceeded to Scotland, where a sermon was preached at Darnedd Muir in the same year. His life was now exposed to great hazards; he was obliged to move from place to place, and was often reduced to great destitution. In 1684 he published his Apologetic Declaration, for which he was outlawed. When James II. came to the throne in 1685 Renwick with 200 men went to Sanguhar, and published a declaration rejecting him. A reward of £100 was offered for his capture, he was hunted from place to place, and made many hairbreadth escapes, but was at last captured in Edinburgh. He was condemned and executed, 17th February 1688.

See Shield's Life, Renwick's Choice Collection of Sermons, &c. (1777), Simpson's Life of Renwick (1843).

**Renwick, James, LL.D., author and physicist**, was born at Liverpool in 1750, and graduated at Columbia College, New York, in 1807. In 1820 he was made professor of Chemistry and Physics in that college, a position he held until 1833. In 1838 he was appointed by the United States government one of the commissioners to explore the line of the boundary between Maine and New Brunswick. He published a number of books and treatises, Outlines of Natural Philosophy (1822-23), the first extended work of its kind published in the United States, a Treatise on the Steam-engine (1830), several books on Mechanics, and Lives of De Witt Clinton, Jay and Hamilton, and others. He died 12th January 1863.—One of his sons, James, was architect of Grace Church and St. Patrick's Cathedral, New York; other notable buildings from his designs are the Smithsonian Institution, Vassar College, &c.

**Repairs** is the legal as well as popular term to denote the repairs done to a house or tenement by the landlord who is the owner of the lease. In England the burden of repairs is at common law thrown on the tenant, so that, unless the lease expressly say that the landlord is to do the repairs, the tenant will be bound to use the premises fairly and to keep the house property, and to repair to the best of his ability the defects which he is to do the repairs. In the lease of farms the tenant is bound only to keep the house in repair, and not the out-buildings, though he is bound to keep the fences in repair. If the landlord is bound to do the repairs, and fails to do them, he is entitled to quit the premises on that account, though he will be entitled to sue the landlord for damage caused by the want of repairs. In Scotland the landlord is bound at common law to put the premises into tenantable repair at the commencement of the lease. The tenant is then bound to keep them in ordinary repair, but not to keep them in repair where some hurricane or extra ordinary cause destroys them. In the United States the laws of the states vary; in several states it is enacted that a general promise to repair shall not bind the tenant to rebuild in case of destruction by fire.

**Repeal.** See O'Connell.

**Repealing Rifle.** See Rifles.

**Repentance, Stool of.** See Stool of Repentance.

**Replevin, in English law, is a form of action by which goods which have been seized under a distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.**

**Reporting, an important branch of journalism, has already been incidentally discussed at Newspaper; the methods by which, as a rule, it is practicable are dealt with at Shortland. Here some account of the history of parliamentary reporting, in many respects the most important, is given.**

Accounts of single speeches, and, at times, of entire debates in the English parliament, have come down to us from a very early period. The earlier volumes of the Journals of the House of Commons contain short notes of speeches; the later volumes record nothing but the votes and proceedings. See Symposium. D'Ewes edited the Journals of Queen Elizabeth's Parliaments; and the Commons' Journals contain notes of speeches in the parliaments of James I. Rushworth, assistant-clerk in the Long Parliament, 1640, took down in a species of shorthand any speech of importance; and his account of Remarkable Proceedings in Five Parliaments forms one of the most valuable portions of his Historical Collections. During the reign of William III. a member now and then sent a copy of his speech to the newspapers, for printing which, however, they were sometimes called to account. In the reign of Queen Anne a monthly pamphlet, called the Political State, gave an outline of the debates in parliament. In the reign of George I. the Historical Register, published annually, professed to give reports of parliamentary speeches. In 1824 the Edinburgh Magazine began a monthly publication of the debates, the number for August 1735 containing a report of the debate in the House of Lords on the previous 23d January. Cave, the publisher, continued the practice in succeeding numbers, and his systematic proceedings are thus described by Sir John Hawkins: 'Taking with him a friend or two, he found means to procure for them and himself admission into the gallery of the House of Commons, or to some concealed station in the other house, and there they preserved by dictation the almost entire speeches, and the general tendency and substance of the arguments. Thus furnished, Cave and his associates would adjourn to a neighbouring tavern, and compare and adjust their notes; by means whereof, and the help of their memories, they put down the substance of the several speeches, and the general tendency and substance of what they had lately heard and remarked. The reducing this crude matter into form was the work of a future day and an abler hand—Guthrie, the historian, whom Cave retained for the purpose.' There was, however, no publication of the debates during the sitting of the Houses; parliament was always prorogued before anything said in the course of the session was given in the magazine. At first the names of the speakers were cautiously indicated by the first and last
letter only, and in many cases the speaker's name was wholly omitted. Growing bolder by degrees, Cave printed the name at length. The House of Commons followed the same example. The publication of the debates of either House had been repeatedly declared to be a breach of privilege—as by the Commons in 1688 and by the Lords in 1698. The Commons followed up several previous resolutions to the same effect by ordering, in 1728, 'that it is an indignity to, and a breach of, the privilege of this House for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper this House will proceed against the offenders with the utmost severity.' In 1738 Speaker Onslow called the attention of the House to the breach of its standing orders by Cave and others; and the result was another thundering resolution against the publication of debates 'either while parliament is sitting or during the recess,' and a threat to proceed against offenders with the 'utmost severity.' The reports, notwithstanding, still appeared, but under the disguise of ' Debates in the Senate of Lilliput,' in the Gentleman's Magazine; and ' Debates in the Political Club,' in the London Magazine. Dr Samuel Johnson was one of the more prominent part of this parliamentary debates, and the reports from 1740 to 1743 are held to have been entirely prepared by him, sometimes with the assistance of the above-mentioned Guthrie. When it was observed to Johnson that he dealt out reason and eloquence pretty equally to both parties, he remarked, 'I took care that the Whig dogs should not have the best of it.' It was not till thirty years later that the parliamentary debates descended from the magazines to the newspapers. The latter had, however, for some time resolved to report the debates, and they took advantage of the popular excitement arising out of the Lintrell-Wilkes election for Middlesex to try the right of the House to interdict the publication of its proceedings.

The ever-contestable contest between parliament and the press began at the close of the year 1776. The London Press, in their resolutions following the threat by prompt action; and the Lord Mayor of London and Alderman Oliver were sent to the Tower for refusing to arrest some printers of reports on the warrant of the Speaker, John Wilkes taking an active share in the controversy. The House of Commons loudly protested against the arbitrary proceedings of the House, and the whole country responded to the appeal. The power of parliament to imprison ceases at the end of the current session, and on the day of prorogation, July 23, the Lord Mayor and Alderman Oliver marched out of the Tower in triumph, and at night the city was illuminated. Next session the House of Commons tacitly acknowledged itself beaten. The printers Delhi the House, continued to publish their proceedings, and slept, notwithstanding, secure in their beds. In a short time the House of Lords also conceded the point, and the victory was complete; though it is still in the power of any member, who may call the Speaker's attention to the fact that 'strangers are present,' to exclude the public and the reporters from the House. This power has frequently been exercised during living memory, has been used in an occasion, or by any member who has dissented from this course have taken notes of the speeches, and have avowedly sent them to the newspapers.

Roussé (Fr.). This term is applied to a peculiar method of ornamenting metal which resembles Embossing (q.v.). Briefly stated, it is metal-work formed in relief by striking the sheet, usually a thin one, from behind with hammer or punch, the rough forms so produced being afterwards chased or otherwise finished. After the parts which require to be convex are 'raised' from the back or inside of any object, such as a vase or flat dish, it is either filled with or placed on a bed of pitch and then worked upon the punch, and afterwards chased or otherwise finished. Stamping produces work somewhat similar in general appearance, but of a much more mechanical nature, since the die used determines exactly the pattern, and no variety is obtained. See Direct and Repousse, one kind of hammered iron, again, such as open ornamental gates and grilles, are examples of forging
that of repoussé. Among the best existing pieces of ancient Greek bronze sculpture some have been beaten up (not cast), and are therefore of the same kind as those objects of which the relief is a true artistic sense) in France about the middle of the 19th century. Some of the finest modern works in repoussé have been executed by Antoine Véchta and Morel Ladeuil. One of the largest objects ever produced in repoussé in England is the Elelo Volunteer Challenge Shield. It is of iron, 6 feet high, and was designed by F. Watts, R.A. Elaborate work in repoussé is necessarily very costly, especially if the metal employed is hard, such as iron, copper, or silver, which is usually the case when important designs are to be executed. But the process is also applied in Birmingham to decorate comparatively cheap articles in Britannia metal, which is soft and easily worked.

Representation, in politics, is the function performed by the elected members of legislative and administrative bodies. Ancient democracies were tried by lot on important questions of government by the whole body of citizens; at Athens, for example, all important questions were decided by the vote of the Ecclesia. In England, as in many other countries, the freemen of towns and small districts elected their own officers and managed their own affairs; the sheriff of the early times was attended by the reeve and four men from each township; it was, in fact, a representative assembly, properly so called. When the smaller kingdoms were united under one head the change was not at first favourable to popular government; it was impossible in those days to bring together representatives from a wide area; and the conduct of national affairs fell into the hands of the king and his councillors and the great men of the realm. But feudal custom required that a superior should consult his vassals, or that he should consult levies on the country; under the influence of this idea courts or assemblies of a more or less representative character were formed throughout western Europe. In England the high court of Parliament (q.v.) was originally based on feudal lines in the neigh-bouring parliament of Scotland; but the principle of representation was applied as early as the 13th century to the shires and boroughs of England generally.

In framing or criticising the constitution of a representative body we encounter practical questions of considerable interest. We have to determine, first, who ought to elect, whether a property qualification should be required, whether owners of property should have more than one vote, whether manhood suffrage, household suffrage, or a franchise based on wealth or education, or a combination of the two, should be used, and whether women ought to be allowed to vote. We have then to consider how the electors are to be grouped. The scheme of single-member districts adopted in 1884-85 in the United Kingdom represented all house minorities; local minorities are excluded, and votes may be so distributed that a majority of members is returned by a minority of electors. Mr Thomas Hare (1806-91) was the author of a scheme of proportional representation, in which the whole country is treated as one constituency, each elector has one vote, and any candidate obtaining the necessary quota of votes is elected, while provision is made for transferring votes from a candidate who obtains more than the quota by enabling an elector to vote for several names in the order of his preference. It is contended that this plan, if adopted, would make the House of Commons a perfect model of democratic representation, but it has not yet attracted any great amount of popular support. After the lapse of about a century the one man, one vote' shibboleth of Major John Cartwright (1740-1824) has been recently revived. In school board elections the voting for representatives is cumulative; the voter has a right to as many votes as there are members to be elected, and may give all his votes or as many as he chooses to one candidate. Passing from election law, we have to consider what are the duties of elected representatives, and what should be their relation to their constituents. Should they be paid? Should they have a long term of office, that they may learn their business, or a short term, that they may never forget their dependence on the electors? Are they delegates, bound to act on the instructions of those who appoint them, or is it their duty to act on their own judgment, and to do what is best for the general welfare? The accepted theory in England is that a member is not a delegate: his constituents have no power to withdraw their mandate, and the member is bound to act on his own judgment. But the highly organised parliaments of the western democracies, which have been maintained by the vote of the individual, have given freedom to the individual representative; he can only secure election by pledging himself to vote with his party on certain issues.

For a full discussion of these and other questions, see J. S. Mill, Representative Government (1861; new ed. 1884); T. Hare, The Election of Parliamentary Representa-
tives (1859; new ed. 1865); Walpole, The Electorate and the Legislature (1881). Many interesting political experiments are described in Bryce's American Common-wealth (1888); see also the report of the joint commission of the United States, see Congress, President, United States. Representation was not the original system even in republics (see Republic), but direct voting of all citizens; this old system is still practised in some of the smaller cantons of Switzerland (q.v.).

Reproyle (Fr. reprendre, 'to take back') is the suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of reprieve is exercised in two ways: the sentence is stayed by the judge, whereupon the prisoner is released pending the hearing of the case, or until the court shall determine whether he is guilty or not; or, a verdict has been passed against him, and the judge may, on his own motion or on the application of the prisoner, give him an opportunity to show that there is no cause for the sentence, and may, if satisfied of this fact, either discharges him, or acquit him, or reduce the punishment. If this is not done, the prisoner is brought to the execution of the sentence. If he be found guilty his name is placed on the list of ex-reprieved. When he is found innocent the judge states his reason for the sentence, which is published.

Reprisal is repeated taking, from an enemy, goods which he has seized, as a retaliation for the seizure of goods from him of other goods, the equivalent of the damage he has sustained. Letters of Repreisal are the same as Letters of Marque. See Letter of Marque.

Reproduction. See Predestination.

Reproduction is the term applied to the whole process whereby life is continued from generation to generation. One of the characteristics of life is
its continuity; the races of animals and the orders of plants live on without marked change for centuries; by slow modifications they may enlarge or diminish, become impoverished, increased or thinned, but there is no breach of continuity. All the forms of life seem to evolutionists like twigs on one many-branched tree; they are genetically related by near or distant bonds of kinship, and in a very real sense each generation is continued with those which came before and after. As an evergreen tree replaces by fresh growth those leaves which it loses, so, throughout the world, by various forms of reproduction the continuance of life is secured. As reproduction is a fundamental fact of life, it cannot be discussed apart from other facts, such as growth, at the limit of which reproduction usually occurs, or development, in which the germ grows into the likeness of its parent, or the occurrence of two sexes producing complementary and mutually dependent reproductive elements. A theory of reproduction must be consistent with the facts of growth and development, and merge into theories of sex and of heredity—the latter being based on a study of the precise relations between successive generations. See Embryology, Heredity, Sex.

Modes of Reproduction.—Separated fragments of a sponge or cuttings from eutrochial worms, buds of a hydra, or the bulbs of a lily, the eggs of birds, and the seeds of plants are alike able to grow into new organisms; and thus we see that the common fact about all kinds of reproduction is that parts of one organism are separated from the parent life, either as buds or daughter-cells. The formation of many daughter-cells or spores is more than ordinary division taking place repeatedly in rapid succession, and within the substance of the parent-cell—in other words, in limited time and space.

We have seen that reproduction begins among the single-celled plants and animals. There may be found an organism-like Schizomus, multiply- ing by breakage or reproducing by rupture, presumably when the cell has overgrown its normal size; in others numerous buds are liberated at once, as in Arcella and Helomyxa; in many, familiarly in the yeast-plant, one bud is formed at a time; in most the cell divides into parts, and these divide again and again. The formation of many daughter-cells or spores is more than ordinary division taking place repeatedly in rapid succession, and within the substance of the parent-cell—in other words, in limited time and space.

Few plants, like the liverwort and the tiger-lily, a kind of bud may be detached, and thus begin a new life; but among animals the liberation of buds is best illustrated, for this mode of reproduction occurs in hydras and many hydroids, in some 'worms,' and in Polyzoa, and even in animals as highly organised as Tunicates. Budding is usually exhibited by comparatively simple and by sedentary animals, and seems limited to be natural to vegetative organisms. It is easy to understand why asexual reproduction is among many-celled animals always associated with sexual reproduction, and entirely replaced by it in the higher forms. For budding is only possible when the organism is not very large; and then part of the body retains many indifferent units; moreover, it is an expensive way of securing the continuance of generation, and is without the advantage to the species which undoubtedly results from the mingling of two life-currents in sexual reproduction.

Sexual reproduction in its fully differentiated form involves (a) the distinctness of two parent organisms, (b) the formation of two different kinds of reproductive elements—e.g. spermatozoan produced by the male and ovum by the female, and (c) the fertilisation of ovum by spermatozoan. Moreover, the process of sexual reproduction also includes the sexual union of the two parents, or other ways in which fertilisation is secured, while in some cases the fertilised ovum develops in organic relation with the mother-organism, from which it is eventually separated as an embryo. But, while many organisms exhibit fully differentiated sexual reproduction, and while the essentials of the process are always the same, there are not a few important variations in detail—witness the occurrence of hermaphroditism, parthenogenesis, and alternation of generations, the first and last of which are discussed in separate articles.

Physiology of Reproduction.—All growth is, in a certain sense, the nature of reproduction. It is an increase in the amount of protoplasm and its attendant train of substances. Abundance of food material and conditions favourable to rapid assimilation are necessarily accompanied by rapidity of growth; but in the most favourable circumstances there is an inevitable limit to the growth in size of a single cell. It occurs when the rate of assimilation of the constantly increasing mass of protoplasm becomes equal to the rate of absorption of materials for assimilation. Since absorption can only take place through the surfaces, and since, with any given figure of cell, the ratio of volume to surface is a perfectly definite one, and one which increases at a definite rate as the cell grows, there must be for any given figure of cell a perfectly definite limit of size. For any mass of cells arranged in any manner there must be, for similar reasons (though other factors, such as weight, &c., may be operative and varyingly important), a definite limit of size. When in the single-celled animals this limit is reached, or is nearly reached, they cease growing and become germinants. The greater the size of the cell the less rapid, in proportion to volume, must be the absorption, unless at a certain point other factors at present unknown occur—then division of the cell takes place, by which means, the volume remaining the same, the surface of each daughter-cell is increased, and the cell is replenished so that the rate of absorption to surface and therefore of assimilation to absorption is lowered, and growth is once more possible. This law (first clearly stated by Spencer and by Leuckart) is evidently the expression of a factor concerned in the initiation of cell division and growth, and in the regulation of the size of cells. In the Protozoa, then, reproduction is related to, and in a certain sense caused by, a diminution in the possible rate of assimilation, which, to the
protoplasin concerned. It bears the aspect of an
impaired cellular differentiation. The Metazoan, although repro-
duction is not so entirely a matter of cell
division as in the Protozoa, a connection between
nutrition and reproduction is observable. The
common hydra, with an abundant food-supply and
favouring circumstance, grows rapidly, the growth
largely due to the fact that the larva can pass
through the form of the production of numerous
buds, which may themselves produce a crop of
secondary buds. But if the conditions become less
favourable to nutrition through the lessenings of the
supply of food material, or, in terms of the
metazoan, in the case of the larva the steps
involving the production of numerous buds, may
take the form of the production of numerous
buds, which may themselves produce a crop of
secondary buds. But if the conditions become less
favourable to nutrition through the lessenings of the
supply of food material, or, in terms of the
metazoan, in the case of the larva the steps
involving the production of numerous buds, may
take the form of the production of numerous
buds, which may themselves produce a crop of
secondary buds. But if the conditions become less
favourable to nutrition through the lessenings of the
supply of food material, or, in terms of the
metazoan, in the case of the larva the steps
involving the production of numerous buds, may
take the form of the production of numerous
buds, which may themselves produce a crop of
secondary buds. But if the conditions become less

metazoan, in the case of the larva the steps
involving the production of numerous buds, may
...
sole source of transmissible variations in many-celled animals.

In the individual life the antithesis between the reproductive system and the nutritive functions has many expressions, and in terms of this antithesis not a few lines of variations can be rationalised. Thus, the shortening of the axis of the flower seems to be the result of a check imposed upon the vegetative system by the reproduction function; thus, the development of gymnosperms and angiosperms suggests a continuous subdivision of the reproductive carpellary leaf; thus, in almost every natural alliance of phanerogams may be read a contrast between more and less vegetative types, such as is seen within the limits of a single species in the transitions between the leafy kale and the cauliflower. Among animals the antithesis is expressed in different ways—as in the varied degree in which the reproductive individuals of a hydroid colony are differentiated from the nutritive members.

In considering the evolution of animals great importance is always—and rightly—attached to the self-preserving struggles and endeavours which secure the satisfaction of nutritive needs; but the species-maintaining activities of reproduction have been not less important. Thus, Darwin insisted on the dual selection as a fact in evolution, and, though the criticisms of Wallace and others have lessened the cogency of Darwin's argument, there can be little doubt that courtship has aided in the evolution of the psychical life of animals. Romanes, too, in his insistence on the importance of isolation, recognizes 'the reproductive factor in evolution.' For by variations in the reproductive system a species may be divided into mutually sterile types, which, prevented from intercrossing by this physiological barrier, are free to develop along divergent paths. In a variety of connection, Robert Chambers emphasized the importance of 'prolonged gestation,' and Fiske has directed attention to the progressive influence of prolonged infancy, while Miss Buckley has well pointed out that an increase of parental care and sacrifice as seen in birds and mammals has surely been factored in, if not as a result of, the general ascent of animals.

The increase of reproductive sacrifice which we observe in the evolution of mammals and in the progress through oviparous monotremes, prematurely-baring marsupials, and various grades of platybery in the growth of parental care, and the frequent subdivision of self-preserving to species-maintaining ends; and finally, the rise of sociality from foundations based in organic kinship, are well-known facts of animal life which suggest the importance of the reproductive factor in evolution.

Reptile-Fund, the fund so called, described at Hanover, Vol. V. p. 547, was abolished by Capri in 1898.

Reptiles, a very large class of Vertebrate animals, including Tortoises and Turtles, Lizards of many kinds, the divergent New Zealand 'lizard' Sphenodon, Snakes, and Crocodilians—five distinct orders with living representatives, but including also at least as many of wholly extinct types, such as Ichthyosaurs, Plesiosaurs, and Deinosauria.

Reptiles occupy a central position in the Vertebrate series: beneath them are Amphibians and Fishes, above them are Birds and Mammals. They begin the series of 'higher Vertebrates,' which at no period of life are the by-guards of life. Throughout their life are provided with two birth-roles or fetal membranes—a protective amnion and a respiratory allantois. Their relationships seem to be threefold, with the Amphibians, with Birds, and with Mammals. But there is no doubt that they are most closely linked to Birds—a fact first clearly recognised by Huxley, who emphasised the deep structural affinities of Birds and Reptiles by linking them together as Sauropsida, in contrast to Mammalia on the one hand and Ichthyopoda (Amphibians and Fishes) on the other.

Reference to the above article gives a contrast between Mammals, Birds, and Reptiles, we shall simply notice that Reptiles are cold-blooded, the temperature of the body not greatly exceeding that of the surrounding medium; that the heart is three-chambered, except in Crocodilians, where four chambers first occur; that mostly venous blood goes from the heart to the anterior viscera, and mixed blood to the posterior region, only the head and anterior regions receiving purely arterial blood; that the body is covered with scales, with which subjacent bony plates or septa are sometimes associated; the skull articulates by a single condyle with the backbone, and the lower jaw works against the quadrate bone; that the great majority are oviparous, while in some the eggs are hatched within the mother. The earliest remains of Reptiles are found in Permian strata, and the golden age of Reptiles was in Mesozoic, especially in Jurassic and Cretaceous, times.

Classification of Living Reptiles.—As the orders of Reptiles with living representatives are separately discussed, it will be enough here to give a general classification. Order 1, Chelonia: Tortoises and Turtles. 2, Rhynchocephalia: one form—the New Zealand lizard Sphenodon (q.v.), whose extinct ancestors date from the Permian. 3, Lizards: Lizards (q.v.), 4, Ophidia: Snakes (q.v.). 5, Crocodilia: Crocodiles (q.v.). Alligators (q.v.).

Extinct Reptiles.—The classification of the extinct Reptilian types is still very uncertain, but many authorities agree in recognising the following orders:

Anomodontia.—Reptiles with lizard-like body, limbs adapted for walking, biconcave vertebrae, and teeth fixed in sockets. The order is restricted to the New Zealand species and its nearest allies, and is thus almost confined within the Labyrinthodont Amphibians and with Mammals. Among the representative genera are Parapsaurus, Galesaurus, Deurosaurus, Dicyodon, and Placodus.

Sauropterygia.—Reptiles without exoskeleton, with long neck and short tail, limbs adapted for walking or for swimming, biconcave vertebrae, teeth fixed in sockets. All of them seem to have been carnivorous. The order is represented by the Trias to the Upper Cretaceous, and exhibits affinities with Amphibians. Among the representative genera are Plesiosaurus, Mosasaurus, and Nothosaurus.

Ichthopterygia.—Marine Reptiles, with whale-like body, without exoskeleton, with limbs modified as paddles, with biconcave vertebrae, with teeth implanted in a continuous groove. Many were carnivorous, others lived on fish and molluscs; there is some evidence that some were viviparous, the fossilised young being found in the fossilised mothers. The order is represented from the Upper Trias to the Upper Cretaceous, and exhibits affinities with Labyrinthodont Amphibians and with the New Zealand lizard Sphenodon. The largest Ichthyopterygians are Ichthyosaurus and Ophthalmosaurus. Some attained a length of 30 to 40 feet.

Rhynchocephalia.—As Sphenodon is the only
REPTON

surviving representative of the Rhynchocephalia, the order may be almost regarded as extinct. It is represented by Palaeotheria from the Permian, besides Champsosaurus, Hyperodapedon, Rhynchosaurus from later strata. Within or near this order may also be included a remarkable form Protosaurus from the Permian, a type for which habitation has exhibited the distinct order Protosaurus. The special interest of these forms is, according to Baur, that they 'are certainly the most generalised group of all reptiles and come nearest, in many respects, to that order of reptiles from which they are not derived.'

Dinosaurus.-The largest land Reptiles of crocodilian or more bird-like form, represented from the Trias to the Upper Chalk, exhibiting affinities with crocodiles and with birds. Representative genera are Iguanodon (sometimes measuring about 30 feet), Camptosaurus, Scelidosaurus, Stegosaurus, Ceratops (with long horns on the skull), Megalosaurus, Ceratosaurus (also horned), Brontosaurus (upwards of 50 feet in length), Atlantosaurus (with a femur 6 feet long).

Oviraptorousa.-Flying reptiles, often called Pteranodon, the scale of skin extended on the greatly elongated outermost finger. The order is represented from the Lias to the Upper Chalk by such genera as Pteranodon, Pterodactylus, Diaphorodon, and Rhamphorhynchus. Some had an expanse of wing of about 25 feet, but many were smaller. See Mivart, Monograph of the Pterodactyli (1874).

REPTON, a village of Derbyshire, 61 miles SSW. of Derby and 41 N.E. of Burton-upon-Trent. Here was founded the first Christian church in Mercia, of which Repton for a while was the royal and episcopal capital. It was the seat from before 690 till its destruction by the Danes in 874 of a celebrated monastery, as afterwards of an Austeri priory from 1172 till the Dissolution. Remains of this priory are incorporated in the buildings of the free grammar-school, which, founded in 1556 by Sir John Porte, has risen to be one of the great English public schools, with an endowment of £2000, eight scholarships and several entrance exhib- ited. Some 2200, and 2750. Among its former pupils have been Justice Denman, Bishop Piers Claughton, Professor Saniday, and J. E. Saniday, the public orator at Cambridge. The parish church has a graceful spire and a very interesting Saxon crypt, 17 feet square. Pop. of parish, 2000. See Biggins’s History of Repton (1854).

Republic, a party name in American politics, which has had at different times different significations. The first use of the name was in 1776; it was the alternative title of the Anti-federalists, who advocated the sovereignty of the states and the rights of the people, and finally secured those amendments and additions to the Constitution which were intended to secure state rights, and which declared that all powers not expressly granted to Congress by the Constitution are retained by the states or the people. Before the war of 1812, however, the term Democrats (q.v.) had been substituted as the title of the party; and the name of Republican was first used in 1856, when it was taken up by the new party which was organised to oppose the Democrats, its original holders. This party was formed to combat the extension of slavery; it appealed to all who were opposed to the repeal of the Missouri Compromise (see Missouri) and the efforts to make Kansas a slave state (see Kansas). It grew out of the Free-soil party (see Free-soilers), and at once took the place, as opponents of the Democrats, that the Whig party, which had died of overcompromise, had for some time feebly held. In 1856 it nominated Fremont for President of the free soil fight. The decision in the Dred Scott Case (q.v.) and the progress of events in Kansas greatly strengthened the party, and after the divisions among the Democrats over the same question in 1860 the success of the Republicans was assured. Elected Lincoln in that year, they held office
continuously from 1861 to 1885, the Republican presidents being Lincoln, Johnson, Grant (twice), Hayes, Garfield, and Arthur; and in 1888 they were again successful, electing Benjamin Harrison. The conduct of the civil war was in the hands of the Republican party, although, of course, northern Democrats formed a large proportion of the Union armies. For its history, see United States; and see the text. Republicans claim great credit for their management of the finances of the nation, which brought about the resumption of specific payment. The tariff was long the principal issue between Republicans and Democrats, the former being strong protectionists, the latter advocating tariff revision and the placing of some articles on the free list. This was the issue in the presidential campaigns of 1888 and 1892. In 1896 and 1900, however, the issue was complicated by Democratic demands for the free and unlimited coinage of silver, accompanied in 1896 by a protest against "Imperialism."

Republican Bird. See Weaver Bird. Repudiation, an unprincipled method for the extinguishment of a debt, by simply refusing to acknowledge the obligation, which has been adopted notoriously by several states of the American Union; Hayti has been the next worst offender. The eleventh amendment of the Constitution of the United States prohibits citizens of another or a foreign state from bringing suits against a state in the federal courts; while the individual states, not being independent sovereigns, could only be called to account by a foreign power through the national government. Reprisals or war are thus as impossible as a suit at law, and there is really no means by which the states can be compelled to recognize and meet their obligations. Twice in the history of the country have several states taken advantage of this condition of affairs—once after the commercial crisis of 1839, in which the United States Bank stopped payment, and again in the years following the civil war. In the latter period Virginia, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Arkansas were among the defaulters. Virginia, indeed, refused payment chiefly on the ground that no part of its existing debt had been allocated to West Virginia when the latter was separated as a state in 1863; and later acts of repudiation have found a local justification in the same grievances. But in the other states repudiation is to be traced to the effects of the war and to the unsettled government which ensued. The rebellion had left commerce in these states prostrate and paralysed, and especially was it necessary that railways should be rebuilt and new roads constructed; and to this end the public credit was pledged, often recklessly and at ruinous rates. In most cases the debts created in aid of railways were repudiated on the ground that the money had been obtained collusively and with no proper form of benefit to the states: North Carolina thus wiped off an obligation of more than $12,000,000. The other states mostly based their action on decisions of their own courts or on the action of their own legislatures; but such decisions are to be regarded as ultra vires, and in their action they are not justified by law at all, but were simply taking advantage of the fact that they could not be compelled to pay.

Requeüa, a town of Spain, 37 miles W. of Valencia, cultivates silkworms, saffron, and fruits. Pop. 13,927.

Requests, Court of, an ancient court of equity in England, inferior to the Court of Chancery, and abolished 1841. Also, a local tribunal (known likewise by the name of Court of Consequence) instituted in London by Henry VIII, for the recovery of small debts. Similar local tribunals elsewhere have all been sanctioned by the county courts.

Requiem (Lat. requies, "rest"), a dirge or solemn service for the dead in the Roman Catholic Church. It consists in the celebration of the mass Pro Pauca et Eius Memoria ("For the Faithful Departed"), the first words of the Introit of which are Requiem aeterna.

Reredos (Fr.), the wall or screen at the back of an altar. It is usually in the form of a screen detached from the east wall, and is adorned with niches, statutes, &c., or with paintings or tapestry. In some cases it is attached to the east wall and is of great size, covering the whole of the wall, as at All Souls College, Oxford. That splendid 15th-century reredos had been plastered over at the Reformation, but was discovered and restored in 1872-76. In Durham Cathedral is a very fine example of a reredos in the form of a detached screen; it was brought by sea to Newcastle from London by Lord Neville in 1380, being perhaps of French workmanship, and was restored in 1846. The lofty reredos (c. 1480) at St Albans, dividing the presbytery from the retro-choir, is of the same type and age as that at Winchester.

Reredos, Salisbury Cathedral.
officially pronounced to them. *Rescripta principis* were one of the authoritative sources of the civil law, and consisted of the answers of the emperor to those who consulted him, either as public functionaries or as individuals on questions of law. They were often applied for by private persons, more especially women and soldiers, to solve their doubts or grant them privileges. The rescripts directed to corporate and municipal bodies were known as *Pragmatica sanctiones*, a name which is still applied to the public law of Europe (see *Pragmatic SANCTION*). Rescripts might gradually come to have the force of law, in so far as their determinations in particular cases were of general application.

**Rescue**, in English law, is the illegal delivery and discharge of a prisoner or of goods out of the custody of the law. If, for example, a tenant whose goods are distrained for rent take them by force from the bailiff, the dis-trainer has a right of action against the person who rescues the goods. A person who rescues a prisoner accused or convicted of treason, felony, or misdemeanor is himself liable to prosecution, &c. The punishment varies with the gravity of the charge. A person who rescues or attempts to rescue a murderer going to execution is liable to penal servitude for life.

**Resedaceae**, a natural order of plants, mostly herbsaceous, having alternate leaves and terminal spikes of hermaphrodite irregular flowers. There are some few species, mostly unknown in Europe and the west of Asia, and mostly mere weeds. Webb (q.v.) and Mignonneau (q.v.) are the species most worthy of notice.

**Reservation, Mental.** (Lat. *reservatio* or *restric-<tio mentalis*), the act of reserving or holding back some word or clause which is necessary to convey fully the meaning really intended by the speaker. It differs from equivocation (Lat. *equivocatio* or *ambiguitas*) in this, that in the latter the words employed, although doubtful, and perhaps not fitted naturally to convey the real meaning of the speaker, are yet, absolutely speaking, and without the addition of any further word or clause, susceptible of that meaning. Few questions in casuistry have excited more controversy, or have been the subject of fiercer recrimination, than that of the lawfulness of equivocation and mental reservation. In the celebrated Letters of Pascal (q.v.) against the Jesuits, this was one of the most prominent and, used as he employed it, the most effective topics; and Pascal's charges against the Jesuit casuistry of that day have been repeated in almost every popular controversy on the subject which has since arisen. There are several varieties of mental reservation, differing from each other, and all differing from equivocation. But as regards the morality of the subject all the forms of language calculated to deceive may be classed together. Mental reservation is of two kinds, purely mental and not purely mental. The former is meant a mental reservation which cannot be detected, whether in the words themselves, or in the circumstances in which they are spoken. Of this kind would be the mental reservation implied if a person, on being asked if he had seen A. B. (who had been questioned), said truly, and without searching, to reply: 'I have not seen him,' meaning 'riding on horseback.' A 'not purely mental' reservation is that which, although not naturally implied or contained in the words, may nevertheless be inferred or suspected, either from the words or the circumstances in which they are used. Of this kind would be the mental reservation of a servant, in giving the ordinary answer to a visitor's inquiry for his master: 'Not at home,' although his master were really in the house; or that of a confessor, who, in a country where the privileges of the secret of the confessional are known and admitted, on being asked whether a certain person had committed the confession to his conscience, and having confessed that he had committed, should answer: 'I do not know,' meaning 'outside of the confessional.' And, in general, all such doubtful forms, whether of mental reservation or of equivocation, may be divided into discoverable and undiscov-erable, in which the former is always found against the casuists for their teaching on this head has arisen from the confusion of their views as to these two classes of mental reservation.

According to the most approved Catholic authorities, 'purely mental' reservations and 'absolutely undiscoverable' equivocations are held to be in all cases unlawful, such forms of speech being in truth lies, inasmuch as they have but one real sense, which is not the sense intended by the person who uses them, and hence can only serve to deceive. This doctrine is held by all sound Catholic casuists, and the contradictory doctrine is expressly condemned by Pope Innocent XI. (Prop. 26, 27). On the contrary, mental reservations 'not purely mental' and 'discoverable' equivocations are held to be not inconsistent with truth, and in certain circumstances there is a compelling reason for resorting to them, allowable. An historical example of such equivocation or reservation is in the well-known answer of St. Athanasius to the question of the party who were in pursuit of him, and who, overtaking him, but not knowing his person, asked him why he was going. 'He is not far off,' replied Athanasius, and the party passed on in pursuit. And an ordinary example of discoverable mental reservation is that of a person who, on being asked by one to whom he could not with safety give a refusal, whether he has any money, should reply: 'No,' meaning 'none to lend to you.' In order, however, to justify the use of these devices of speech, casuists require that there shall be some grave and urgent reason on the speaker's part; as, for example, the necessity of keeping a state secret, or a secret of the confessional, or that of a professional character, or even the confidence entrusted by a friend, or the ordinary and fitting privacy which is required for the comfort and security of domestic life and of the peaceful intercourse of society; and that the equivocated sense of the form of speech employed, although it may be actually unsafe or want extra care and even unlikely to be discovered, may yet be, in all the circumstances, really discoverable. Some Protest-ant moralists admit that in some cases even equivo-cation is permissible; if any such reservations are allowed it is obvious there must be great difficulty in drawing a line between reservations that are permissible and those that are not. See CASUISTRY; Lugnoti's works; and Cardinal Newman's *Apologia*.

**Reservation of the Sacrament.** See *LORD'S SUPPER*, Vol. VI. p. 717.

**Reserved List,** in the Royal Navy, a device which formerly existed for expediting the promotion of officers who were still of an age for active service. Under certain Orders in Council of 1851 and 1853, officers who had been gazetted for promotion to the next grade on the Reserved List. This formed a bar to any further promotion; and removed the officer from active employment, except in the remote contingency of the Active List being exhausted, when these 'reserved' officers were liable to be called upon to serve. For all practical purposes, however, the Reserved List was a retired list. The officers placed on it obtained the half-pay of the rank to which they were
RESERVES

Reserves. In the organisation of the military resources of most European countries the reserve forces are, first, those soldiers who, having served some time in the regular army, are still liable to be called upon to serve it when raised from a peace to a war establishment on mobilisation; and secondly, those who are liable to be called upon to follow in second and third lines if the occasion requires. Thus, in Germany and Austria the regular army and its reserves have behind them the Landwehr and Landsturm. In France the Territorial Army and its reserves form the second line, and in Russia the militia takes a similar position. Liability to serve in one or other of these reserves lasts generally from about the age of twenty to forty-two.

In Great Britain there are two reserves—viz., the Naval Reserve and the Militia Reserve. The first consists of two classes, but the second class, some 900 pensioners of Chelsea and Greenwich hospitals, is gradually disappearing, and is not liable for service out of the United Kingdom. The first class (Army, 15,000; Royal Naval Reserve, 10,000) consists of men who served from three to eight years in the regular army, and are liable during the remainder of their twelve years' term of enlistment to be called back into the ranks in case of national danger or great emergency. They can be called out for twelve days' training in each year and in aid of the civil power, are paid £3 a year quarterly in arrear, and may re-engage for a further term of four years' service reserve at 4d. a day. They are called to the ranks by proclamation of Her Majesty in council, the occasion being formally communicated to parliament if sitting. The Militia Reserve consists of militiamen who, for an extra £1 annual bounty, take the liability to be called upon to serve in the regular army abroad or at home whenever the army reserve is called out on permanent service. Otherwise they do not serve in the regular army. One year in the Militia (v.x.), the yeomanry, and the volunteers form a second line of defence for the United Kingdom in case of invasion.

The native army of India has two reserves, active and garrison. The first is formed of men who have served not less than five or more than twelve years with the colours; the second of those who have completed twenty-one years' colour service.

A reserve, on the battlefield, is a body of troops held back by the commanding officer so as to be ready to meet a counter-attack, to support a success, or cover a retirement.

The Naval Reserve is the subject of a separate article.

Reservoir. See Water-supply.

Resil, a town of Persia, capital of the province of Gilan, stands near the south-west shore of the Caspian Sea, 150 miles NW. of Tehran. Silk is grown and manufactured; and rice and tobacco are cultivated. The port of the place is Eazeli, on the other side of the bay on which Resil stands, and 16 miles distant. Pop. upwards of 25,000.

Residence. See Domicle.

Resin. See Legacy.

Resins, a town of Italy, 4 miles SE. of Naples, at the foot of Vesuvius, and facing the sea. Pop. 13,626. Resina is built on the site of ancient Heracleanum, and was in part destroyed by the lava outburst of 1631.

Resins. A class of natural vegetable products composed of carbon, hydrogen, and oxygen. They are closely allied to the essential oils, all of which, when exposed to the air, absorb oxygen, and finally become converted into substances having the characters of resins; and in some cases these substances obtained by the action of plants on them yield them mixed with and dissolved in a corresponding essential oil. Like the natural oils, the natural resins are usually mixtures of two or more distinct resins, which admit of separation by their unequal solubility in different fluids.

The following are the general characters of this class of compounds. At ordinary temperatures they are solid, translucent, and for the most part coloured, although some are colourless and transparent. Some are devoid of odour, while others give off an aromatic fragrance from the admixture of an essential oil. In their crude state they never crystallise, but are amorphous and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoke. They are usually described as non-volatile, but it has been shown that common resin may be distilled in a current of superheated steam. They are insoluble in water, but dissolve in alcohol, ether, and the essential and fixed oils. They are insulators or non-conductors of heat, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions reden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by the chloride of sodium.

The resins are divisible into the hard resins, the soft resins, and the gum-resins. The hard resins are at ordinary temperatures solid and brittle; they are easily pulverised, and contain little or no essential oil. Under this head are included equal, the varieties of lac, mastic, and sandarac, and the resins of benzoil (commonly called gum-benzoil), jalap, guaiacum, &c. The soft resins admit of being moulded by the hand, and some of them are viscous and semi-fluid, in which case they are termed balsams. They consist of solutions of gums and resins in essential oils, or admixtures of the two. They become oxidised and hardened by exposure to the air into the first class of resins. Under this head are placed turpentine, storax, balsam of copaiba, and the balsams of Canopi, Peru, and Tolu. The gum-resins are the resinous juices of certain plants solidified by exposure to air. For these, see Gum.

The resins are very widely diffused throughout the vegetable kingdom. They are generally obtained by making incisions into the wood of the trees which produce them; sometimes, however, they are obtained spontaneously, and in other cases they require to be extracted from the wood by boiling alcohol. The crude resins are separated from the essential oils with which they are usually mixed by distillation with water, the resin remaining while the oil and water pass off; and from the gummy and mucilaginous matters by alcohol, which dissolves out the pure resins, which can be precipitated from their alcoholic solution by the addition of water. The resins are extensively employed in medicine and the arts.

Various fossil resins are known, of which the most common is Amber (q.v.). Some chemists place bitumen and asphalt amongst this class; and amongst the fossil resins described by mineralogists may be mentioned Fichtelite, Hartite, Iridite, Ozokerite, Scheerelite, Xyloretin, &c.

The common resin, or resin, of commerce excluding...
Respiration

in a semi-fluid state from several species of pine, especially Pinea tecta, P. malis, P. palustris, and P. ponderosa of North American Respiration, the pine, and P. Laricio of southern Europe, and P. sylvestris of northern Europe. The crude article, consisting of turpentnine and resin proper, is subjected to distillation, when the resin alone remains behind. The resin thus procured is used very extensively in the manufacture of thin paper and various other purposes, including the preparation of ointments and plasters in pharmacy.

The other resins most generally known and used in Europe, and here all treated in separate articles, are Anime, Copal, Durmast, Mastic, Frankincense, Lac, and Kauri Gum.

Res Judicata, in Law, means that the subject-matter of an action has been already decided by a court of competent jurisdiction. A matter so decided cannot again be made a ground of action, as between the same parties.

Resolution, in Music, the relieving of a discord by a following concord; see Harmony. For the Resolution of Forces, see Composition.

Respiration, or Breathing, is a part of the life of all organisms, animal and vegetable. It is a series of chemical changes, the first of which is the absorption of oxygen into the body, and the last of which is the excretion of carbonic acid. The breathing within the living organism consists of the intake of oxygen and the excretion of carbonic acid with the same organs, the lungs, due to the fact that both the food-stuff and the waste-stuff are gases, and not to any immediate connection between them. Necessarily any organ adapted to the diffusion of a gas from the air to the blood, must, as in the heart, be separated from the air or water from which and into which they have to pass by thin partitions—by the membranous wall of the breathing organ, and by the thin wall of the blood-vessels. Animals such as the frog, which have thin skins, can respire by them. In some the gases can diffuse through the whole surface of their bodies if the under skin is well supplied with blood-vessels. A frog for this reason can live for days without its lungs, but if its skin be rendered impervious to gases will die very quickly, even with the lungs intact. That air and water can be breathed is evident, if the whole system be divided into thin films, and the respiration must be reduced to a minimum, if indeed it exists at all.

In outer respiration we have two things to consider: (1) The manner in which fresh supplies of oxygen are pumped into the lungs, while the poisonous carbonic acid is pumped out. This may be called the mechanics of respiration. (2) The manner in which oxygen passes from the air in the lungs into the blood, and is held in the blood, and the manner in which the carbonic acid passes from the blood into the air-chambers of the lungs. This may be called the chemistry of respiration.

Structure of Respiratory Mechanism.—This mechanism consists of the lungs, a series of minute air-chambers with a network of capillaries in the walls, the air-passages from the air-chambers of the lungs to the outer air, and the chest-walls with their muscles, which act like bellows and change the air in the lungs. The essentials of the structure of a lung must possess have already been emphasised. The simplest lung that we can imagine would be an elastic membranous bag well supplied with blood-vessels, and with a pipe connecting it with the air; the most complicated that exist are essentially of that construction, the complications that occur having for their object merely the enlarging of the surface exposed to the air. There are first the nose and mouth; these join the upper part of the gullet, known as the pharynx (see illustration at Digestion). From the pharynx arises the windpipe (trachea); this passes through the voice-box (larynx) into the chest-cavity; there it divides into two passages (the bronchii); the bronchi go on dividing again and again, generally into two; the ultimate divisions (the bronchioles) open into clusters of air-chambers. The air-chambers are about 1/4th inch in diameter. It has been estimated that there are some 720 millions
of them, and that their total surface is about 2000 square feet. The walls of the air-chambers are formed of a thin membrane in which the blood and lymph capillaries ramify. Minute openings lead from the air-chambers into the lymph spaces of the membrane. The membranous walls are partly formed of elastic tissue. It is this that gives to the lungs their elasticity. The larger air-passage way (trachea and bronchi) are kept open by horseshoe-shaped plates of cartilage; muscles stretch between the poles of the horseshoe, complete the ring, and permit the size of the passages to vary, at the same time resisting over-distension when the internal pressure rises. These larger air-passage ways are lined by a mucous membrane, containing mucous glands; the innermost layer is a ciliated epithelium; the cartilage and the bony parts are those which give to the lungs their round shape.

and thus keep the passages free from mucus and remove foreign particles. As the passages become smaller they lose their cartilage, and the muscles form a continuous circular layer. The lungs are invested by a membrane (the visceral pleura). At the root of the lungs this membrane is continuous with a membrane which lines the chest-cavity (the parietal pleura). The space between the two is the pleural cavity; it is in reality a large lymph space, and communicates with the lymphatics of the pleura. Owing to the air-pressure within the lungs the two pleurae are closely pressed together, the lungs entirely filling the chest-cavity. If the chest-wall be punctured the lungs partially collapse owing to their elasticity, and the respiratory movements are unable to move the air in the lungs.

The chest is an air-tight chamber enclosing the lungs and the heart. The walls of the chest are formed of bones (the ribs, sternum, and backbone) and muscles; the bones and muscles are so arranged that the size of the chest-cavity can be altered. In this way the chest acts as a bellows and moves air in and out of the lungs. The ribs are sloped slightly downwards, especially after an expiration; when an inspiration is taken certain muscles fix the upper ribs, and those muscles connecting the ribs to each other contract and the ribs are raised, and thus the size of the chest-cavity is increased. At the same time a flat muscle called the Diaphragm (q.v.), which separates the chest cavity from the abdominal cavity, contracts, and after an inspiration is arched upwards (by the pressure of the abdominal viscera upon it, the viscera in turn being pressed upon by the abdominal walls), forcibly contracts, becomes flatter, and therefore enlarges the size of the chest-cavity, forcing the abdominal viscera downwards and causing the abdomen to protrude. (The relation of the lungs to the other main organs will be seen in the illustration at Abdomen; see also that at Diaphragm.) In these two ways, then, the size of the chest-cavity may be increased. The result of this enlargement is that the pressure of the air within the cavities of the lungs is lowered; air therefore from without rushes through the nostrils (one ought not to breathe through one's mouth) down the windpipe into the lungs and dilates them, by the introduction of oxygen. The movements which produce this result are known as the inspiratory movements. In making an expiration the reverse effects are produced; the chest-cavity is made smaller, the pressure of the air in the lungs increases, and some of the air is forced out into the air until the pressures inside and outside are equalised. Ordinary expiration is effected by the elasticity of the lungs, by the fall of the ribs, unsupported by the contraction of the muscles that caused an inspiratory movement, by the elasticity of the cartilages of the ribs which were twisted during inspiration, and by the elasticity of the abdominal wall which was forced outwards by those viscera pushed downwards by the diaphragm. An ordinary inspiration is therefore the result of a number of active muscular contractions, while an ordinary expiration is the result of the elasticity of some of the parts concerned. There are certain other respiratory movements to be considered. During inspiration and expiration the glottis (the opening between the vocal chords of the larynx; see the illustration at Larynx) undergoes a rhythmical widening and narrowing; this movement is greater and more sudden in quiet breathing. At the inspiration the nostrils dilate; in most cases perhaps the inspiration has to be rather a forced one before they do so. Forced expiration occurs when the supply of oxygen is insufficient, or when carbonic acid is built up in the blood. This is assisted by muscles that can aid in enlarging and decreasing the size of the chest-cavity is called into play. The average amount of air, in the case of an individual 5 feet 6 inches in height, that goes in and out of the lungs at each inspiration and expiration is about 20 cubic inches; this is called the tidal air. By means of forced inspiratory movements the inhalation may be increased by 120 cubic inches; by means of a forced expiration the outgoing tidal air may be increased by 90 cubic inches. After the most forced expiration possible there always remain within the air passages about 90 cubic inches of air. So that if we take as deep a breath as possible, and then make as forced an expiration as we can, we shall drive out 120 + 20 + 90 = 230 cubic inches of air. This is termed the respiratory capacity. Since the tidal air is only 20 cubic inches, and 180 cubic inches remain in the chest after an ordinary expiration, it follows the air directly changed during respiration is not that really within the lungs themselves, but is that within the nose, windpipe, and larger bronchi, the pipes that result from the branching of the windpipe. Therefore the changes of the air within the chest cavity are the result of diffusion between it and the purest air of the bronchi, aided by the rush with which the tidal air flows in.

The ordinary respiratory movements differ in the two sexes and at different periods of life. In young children the chest is altered in shape, and partly moved by the movements of the abdominal wall during inspiration is therefore very marked. In men also it is the diaphragm which is chiefly operative, but the ribs are also moved. In women it is the movement of the ribs, especially the lower ones, which is active. The respiratory rhythm is the relation of the acts of inspiration and expiration to each other as regards time. It may be expressed as follows: In. = 3, Ex. = 4, pause = 3. The number of respirations in a healthy person is about fourteen
or eighteen per minute; it is greater (nearly double) in childhood. It varies according to circumstances, exercise, rest, health, disease, &c.; in disease it may fall as low as seven or rise to a hundred.

The proportion of the respiratory movements to heart-beats is not one to one, or two to two; health they vary together. Since the heart and the lungs are contained in the same air-tight cavity, it follows that the variations in size of the heart as it beats must rhythmically affect the pressure of the air in the lungs, causing a succession of minute puffs of air to leave and enter the nostrils. Similarly the alterations in pressure within the chest-cavity affect the heart. Increase of pressure or expiration must (owing to the arrangement of the valves) help the blood to flow out of the heart. Decrease of pressure or inspiration must, for the same reason, help the flow of blood into the heart. The pressure which the respiratory muscles, aided by the elasticity of the parts concerned, can exert is on the average equal to that of 4 inches of mercury. The inspiratory muscles can lower the pressure within the chest-cavity by a much less extent. Further, although where the very air cavity below that of the atmosphere; the greater part of the energy of the inspiratory movements is used in overcoming the elasticity of the lungs, chest-walls, and abdominal walls. The respiratory sounds are two in number: (1) the tubular sound, heard over the chest; (2) the vesicular sound, heard over the whole chest during inspiration, probably caused by the sudden dilatation of the small air-chambers of the lungs, and to friction in the smaller passages. During expiration the vesicular sound is heard when present it is very soft and indistinct, probably due to the air passing out of the air-chambers.

The Nervous Mechanism of the Respiratory Movements.—Although all the muscles concerned in the movements of breathing are voluntary muscles—i.e., can be made to contract by an act of will—yet respiration is normally an entirely involuntary act. This is obvious from the fact that during sleep, or during absence of consciousness caused in any way, respiration goes on as well as during wakefulness. Further, although we are aware of very little, if any, breath or cease to breathe, yet we cannot by any effort of the will suspend the respiratory movements for longer than at most a few minutes at a time. We have seen how many are the muscular movements involved in breathing; and it is obvious that the add, therefore to the centre is necessarily the contraction of all these muscles must be a very nice one—in technical phrase, they must be co-ordinated. Such co-ordination must always be the result of a nervous mechanism, and this co-ordination, together with the fact of the rhythmical nature of the respiratory movements, suggests that the whole must be under the dominance of a nervous centre. The position of this centre has been ascertained by experiment; the whole of the upper part of the brain may be removed, and yet breathing will be unimpaired; but if a certain part of the medulla (see Brain and illustration, Vol. II. p. 388) be injured or removed then all respiratory movements cease at once; the centre must therefore be in that part of the medulla. The centre is bilateral, for destruction of one-half of the medulla will not affect the other. When the medulla is divided the respiratory muscles of that side only. Further, we must conclude that, since inspiration is in its muscular movements antagonistic to expiration, there is an inspiratory centre and an expiratory centre in each of the two halves of the respiratory centre; but, as already noted, the expiratory centre is much more in first forced respiration. The similar centres on each side are so co-ordinated that they act as one centre. This compound centre then is to be regarded as regulating the respiratory movements. We have said that if the medulla be injured the respiratory movements cease at once, and that from this it is concluded that the respiratory centre is in the medulla; but it seems that the movements may continue after destruction of the medulla, or may be produced by the reflex stimulation of some centre by irritating the skin. This subsidiary centre must be in the spinal cord; but it almost certainly is a subsidiary centre, though the matter is not quite settled yet.

Now is the centre 'automatic' in its discharges of nervous impulses, or is it reflexly stimulated into action by the arrival of stimuli from some other part of the body? We know by ordinary experience that the centre may be influenced from without, by impulses arising from higher parts of the brain, or when by will we alter the respiratory rhythm, or when it is affected by emotions, and also by impulses arising from the stimulation of sensory surfaces, as when cold water is dashed against the skin. It is found by experiment that the centre may be influenced in two ways: (1) by nervous impulses; (2) by changes in the blood.

Nervous impulses may affect either the inspiratory or the expiratory part of the centre. It seems that all afferent nerves—i.e. nerves in which the impulses travel towards and not away from the central nervous system—sense the activity of a respiratory centre (see Nervous System). But the vagi (nerves that are distributed to all the viscera) seem to be in specially close relation, beginning as they do close to the respiratory centre in the medulla, and ending in the lungs. If one vagus is cut there is no apparent disturbance; but if both are cut then the breathing becomes slower and deeper. If the end nearest of one of them be stimulated the respiratory rhythm is generally quickened; by a certain extent must obviously result in a standstill of all respiratory movements; the chest-walls remain in the inspiratory phase. But occasionally it happens that stimulation of the central end of a vagus, after both have been cut, produces a further slowing of the movements—they may indeed be entirely stopped; in this case the chest-walls remain in the expiratory phase. From these results it is concluded that the respiratory movements are made up of two kinds of fibres that affect the respiratory centre, one kind that increases the respiratory movements, another that inhibits them; and, further, that when one kind is active in causing increased inspiratory movements the other kind is active in causing depressed expiratory movements. Further, if air be drawn out of the lungs, thus imitating expiration, an inspiratory effort is made; if air be forced into the lungs, thus imitating an inspiratory movement, an expiratory effort is made. Therefore we may conclude that expiration stimulates the inspiratory centre, and that inspiration stimulates the expiratory centre. That the effects from which these conclusions are drawn are due to the stimulation of the vagus endings in the lungs is shown by the fact that they do not occur when the vagi have been divided; and that they are not due to alternation in the state of the essential gases of the blood is shown by the fact that they may be produced by forcing an indifferent gas, such as nitrogen, in and out of the lungs. The respiratory pump is therefore a self-regulating mechanism. If we cut the vagi the respiratory rhythm usually becomes slower, and the movements are deeper;
therefore normally stimuli are constantly passing up the vagi to the centre, and accelerating the discharge of impulses by the centre. Still, an accelerating effect is not the same thing as an initiating stimulus. Two simultaneous impulses on opposite sides of the higher parts of the brain are removed, impulses proceeding from above are not essential; and since when the spinal cord is cut below the medulla the movements of the nostrils and vocal chords continue (although of course all others cease), the centre works independently of sensory impulses arriving from any nerve, except the cranial nerves; and since these cranial nerves may be divided, if the medulla and spinal cord be left intact, without any effect upon the respiratory movements, we may conclude that the centre is automatic in its action, but may be influenced from without.

The more venous the blood the greater is the activity of the centre; when the blood reaches a certain state of impurity convulsions arise. We may conclude that the state of the blood affects the centre directly, and not reflexly, by stimulating the ends of different nerves in various parts of the body; because if the supply of blood be cut off from the medulla alone the same effects are produced. Venous blood differs from arterial blood in containing less oxygen and more carbonic acid.

The deficiency of oxygen is the cause of the greater activity of the centre of animals breathing an atmosphere containing nitrogen; the animal breathes an atmosphere containing sufficient oxygen but excess of carbonic acid, then the convulsions do not occur, but the animal may become unconscious, having been poisoned through some of the higher centres being poisoned.

When in action the centre discharges motor impulses down various nerves to all the muscles concerned in the respiratory movements. If any of the motor nerves be cut, the muscles supplied of course cease, since they are no longer stimulated by impulses proceeding from the centre.

The Chemistry of Respiration.—We have now to explain the passage of oxygen from the air-chambers of the lungs into the blood that circulates in the vessels of the chamber-walls, and the passage of carbonic acid from the blood into the air within the lungs.

In order to understand what follows we shall have to study the laws of diffusion (see also Diffusion). A gas consists of a great number of separate molecules in motion with great speed. The number of these molecules in a cubic inch at the temperature and pressure (1 atmosphere) is estimated about $10^{24}$ to $10^{25}$ molecules. Each molecule has a large path free from collision with other molecules. The average speed of a molecule varies with the temperature, increasing as the temperature rises. The molecules lying near the surface of any mass of gas will constantly impinge upon the boundaries; these impacts are so numerous and so close that they produce an apparently continuous pressure all over the boundary. This pressure obviously depends only upon the density (number of molecules in unit-space) and the temperature (average speed of the molecules) of the gas. Now, however, it may be supposed apart that when two or more gases are mixed their molecules interfere so little with each other that each gas exerts the same pressure upon the walls of the containing vessel as it would do were it alone present. In such a case the total pressure is the sum of the two or more partial pressures of the several gases. If the space in which a gas is enclosed be diminished the molecules are brought nearer to each other, until a point is reached at which many of the molecules apparently act upon each other in such a way as to become more complex molecules, thus forming a liquid in the lower part of the vessel and a gas above. These gases are in motion, and interchange, or diffusion, constantly takes place between the two regions. The number of molecules leaving the gaseous region depends only upon the state (temperature and density) of the gas. The number leaving the liquid depends upon the state (temperature and density) of the liquid. When the diffusion takes place in a closed space a state of equilibrium of interchange is soon reached. In the lungs the liquid molecules of the oxygen of the blood are being constantly moved past the common surface between the air and the blood; the inflow therefore of oxygen from the air into the blood is greater than the outflow from the blood to the air. On the other hand, the gaseous carbonic acid in the air is constantly removed from the common surface between it and the blood; therefore the outflow of carbonic acid from the blood into the air is greater than the inflow from the air into the blood. This picture of the state of matters that regulate the interchange of gases in respiration is simpler than the reality. The further complexity will be described immediately.

We must now consider the laws governing the diffusion when the gas above the liquid is not the gas of the liquid, as is the case when air rests upon a surface of water. Some of the molecules of the air will become entangled in the liquid, will form the liquid of the particular gases within the other liquid, and then the state of affairs will be as before, so far as the gases, and their liquids, of the air are concerned, and a state of equilibrium between each of these gases and its own liquid will be formed. But now suppose that the liquid and the gas have a special chemical affinity for one another, as is the case with the oxygen of the air and a substance in the blood, and as is the case with the carbonic acid of the blood and a substance in the blood. As soon as the gas has diffused into the liquid the chemical compound will be formed; but now the liquid and gas will be in a state of disequilibrium, and the reverse process (at ordinary conditions) will begin, the compound will occur, but slowly, because a greater violence of collision is necessary. Therefore, other things being equal, less pressure will be needed to maintain equilibrium, because fewer liquid molecules of the compound will become gaseous, and diffusion processes (at ordinary conditions) will occur. It is found that at a certain temperature and a certain pressure the dissociation scarcely takes place at all; but if temperature be raised, or if the pressure be lowered to a certain point, then the dissociation will be very rapid.

These laws of diffusion apply to the gases of the blood. In the investigation of these gases a sample of blood is placed under the receiver of an air-pump (thus imitating, though exaggerating, the normal pumping action of the chest-walls), the gases extracted are passed through various solutions which retain the several gases, and thus they may be estimated and examined. The quantity of oxygen obtained from arterial blood is greater than that obtained from venous blood. The arterial blood of a dog yields 23.2 vols. of ordinary pressure, or 175.83 vols. of mixed gases when the external pressure is reduced to zero. This mixture is composed of 23.2 vols. of oxygen, 34.3 vols. of carbonic acid, and 1.8 vols. of nitrogen.

If blood took up as much of these gases by mere diffusion as water does, it would contain 0.86 vols. of oxygen, 1.2 vols. of carbonic acid, and 1.6 vols. of nitrogen. Therefore it is evident that, while
the nitrogen is merely diffused into the blood, the oxygen and the carbonic acid must be combined with some substance or substances in the blood. If we gradually lower the external pressure of the atmosphere upon the blood we notice that at any given temperature (at which the combination can exist) the pressure may be lowered to a certain point without much gas coming off, but that at this point the gases begin to come off rapidly. This is another proof that the gases are combined and not merely absorbed in the blood; for in case of simple absorption the gases come off in equal amounts for equal volumes of air, whereas the amount of the gases that can be taken from blood-plasma (free from blood-cells) is 0·26 vols. of oxygen, 35·26 vols. of carbonic acid, and 2·24 vols. of nitrogen. The great mass of the oxygen is, therefore, not in the plasma, but in the corpuscles; while the great mass of the carbonic acid is in the plasma. The oxygen is found to be united to the red colouring matter, of which the red blood-cells are chiefly composed. This substance is called hemoglobin. It is not so easy to determine in what combination the carbonic acid exists in the plasma. A certain amount is in arterial blood until the partial pressure falls (although the above figures do not show it); indeed, some writers consider that the hemoglobin of these cells is the chief carrier of carbonic acid. The effect of lowered pressure upon blood-plasma, so far as regards carbonic acid, is much the same as it is upon solution in water. It is a general rule that the writers believe that the carbonic acid exists in the plasma in the form of sodium bicarbonate. Others believe that it may be in the form of bisodium hydrogen phosphate. The presence of red blood-corpuscles in a very marked effect upon the disengagement of carbonic acid under lowered pressure; it lasts for a considerably longer time. This effect appears to be due to the presence of oxyhaemoglobin.

The total pressure of the atmosphere is 760 mm. of mercury. The partial pressure of oxygen in the air is 139·6; of carbonic acid, practically zero; of nitrogen, 600·4. Oxygen does not leave arterial blood until the partial pressure falls to 29·64, nor venous blood until the partial pressure falls to 22·04; these are therefore the partial pressures of oxygen in arterial and venous blood. Carbonic acid does not leave the plasma until the partial pressure falls to 21·18, and venous blood until it falls to 41·04. Therefore blood exposed to air would readily gain oxygen and lose carbonic acid. But the air in the part of the lungs where the respiratory interchange takes place is not the same as the air surrounding the body; the partial pressures of expired air will be nearer the true numbers; they are—of oxygen, 121·6; of carbonic acid, 33·4; of nitrogen, 600. But even expired air is not the same as air within the alveoli; for the air taken in and out of the lungs (tidal air) only enters and leaves the larger respiratory passages near the opening into the outer air; from these it diffuses into the air of the alveoli. The partial pressures of this air have been estimated by introducing a collector into the alveoli and taking out samples. Specimens of air collected in this way have been found to have the following partial pressures:

<table>
<thead>
<tr>
<th>Oxygen</th>
<th>Carbonic Acid</th>
</tr>
</thead>
<tbody>
<tr>
<td>29·64</td>
<td>41·04</td>
</tr>
</tbody>
</table>

The vertical line represents the alveolar and capillary wall; the arrows show the direction in which the gas molecules must diffuse. But if we compare the partial pressures in venous blood, in arterial blood, and in alveolar air, a very remarkable fact appears.

<table>
<thead>
<tr>
<th>Alveolar Air</th>
<th>Venous Blood</th>
<th>Arterial Blood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oxygen 27·44</td>
<td>22·04</td>
<td>24·04</td>
</tr>
<tr>
<td>Carbonic Acid 41·04</td>
<td>21·04</td>
<td></td>
</tr>
</tbody>
</table>

The venous blood flows through the lungs, and the carbonic acid of oxygen in arterial blood is higher than it is in alveolar air, the place from which it must have come; while the pressure of carbonic acid in arterial blood is lower than it is in alveolar air, the place to which it has passed. We must therefore conclude that the living alveolar wall has exercised some influence upon the gases in virtue of its secreting and excreting activity; it has done work against the molecular energies that produce diffusion. But the numbers given by various authors for the partial pressures of the gases in the various cases are not always in perfect agreement, and no certain conclusion can be drawn from them. Still in any case the slight differences of partial pressure, especially of oxygen, render the validity of any explanation of the rapidity of gaseous interchange between the lungs in terms of ordinary diffusion entirely extremely doubtful. We can write that, while the exchange has recently been suggested in the sudden stroke of the heart, which would have an accelerating effect upon the liberation of gasses from a fluid under low partial pressure; just as a tap upon the sides of a glass containing soda-water will cause bubbles of carbonic acid to be formed off. Further, as already stated, some carbonic acid is combined with hemoglobin. This combination is, like oxyhaemoglobin, dependent upon the partial pressure of the carbonic acid, and is easily given off when that pressure is lowered. Possibly the hemoglobin may be an important carbonic acid carrier in the blood.

Effects on Respiration of the Quality and Quantity of the Gases of the Atmosphere.—The respiratory mechanism, as well as the whole body, is adapted to work with air of a certain composition and at a certain pressure. The mechanism can adapt itself, within certain limits, to variations of composition and pressure. We have to state what these limits are, and what happens when they are overstepped. We shall study first of all, because of its practical importance, the results of breathing in a confined space, or in one insufficiently ventilated. The effect upon the air of course is that the proportion of oxygen is lowered, and that of carbonic acid increased. The first effect upon a person experiencing such a state of affairs is that a sense of mental and muscular fatigue occurs when the proportion of carbonic acid rises to 0·1 per cent., the normal proportion being 0·04 per cent.; and this is not due to the carbonic acid, but to the presence of organic matter, derived probably from the clothes, of the amount of which the carbonic acid happens to be a measure; for if pure carbonic acid be introduced into the air of a room, until the proportion rises to 1 per cent., no disagreeable sensations are experienced in breathing it. If the proportion of oxygen be still further diminished, or by shutting the trachea of an animal all supply of oxygen to its blood be cut off, the oxygen of the blood begins to be used up, and carbonic acid begins to accumulate, and asphyxia sets in. There are three stages of asphyxia. (1) The breathing becomes deeper and more rapid, the blood-pressure rising at the same time. (2) The respiratory movements continue to increase in force and
RAPIDITY, extra muscles are called into play, the
respiratory movements are especially marked; then
all the muscles that can possibly aid in expiration
are used, the excitement spreads to nearly all the
muscles of the body, and convulsions ensue; these
violent efforts exhaust the body. (3) A stage of
quiet, due to exhaustion, occurs; a few long-drawn
inspiratory gasps are made, these die out; the
whole body is convulsively stretched out, and
death intervenes. When the trachea of a dog is
artificially closed these events run their course in
from four to five minutes; the convulsions appear
at the end of the first minute, and cease suddenly
within the second minute. In drowning death is
often hastened by the entrance of water into the
lungs. The time at which death from drowning
occurs varies with the state of the animal at the
time of the occurrence. Young animals—e.g. a
puppy—in which the respiratory changes are less
active than in adults, may survive an immersion
of fifty minutes; but a full-grown dog rarely
receives after having been 15 minutes under water.
For man, see below, p. 467. By training, as in the
case of divers, the respiratory centre may be
acclimated to the scarcity of oxygen for much
longer than it can normally.

We next consider the effects of changes in the
partial pressures of the gases of the atmosphere,
the blood, and surrounding media, on the
function of the respiratory apparatus. Reduced
partial pressure of oxygen, as already noted, results in asphyxia. Increased
partial pressure of oxygen results in the pheno-
menon known as apnoea. After several very deep
inspirations the state known as apnoea occurs, and it is easy to hold the breath for a longer time than
usual. The usual explanation of this has been
that the oxygenation of the blood is so complete
that there is enough to last some time, and the
centre is not stimulated by its absence or by the
presence of the reducing stuff in the blood. Later
authorities regard the cessation of respiratory
movements which occur when oxygen is rapidly forced
into the lungs by rapidly succeeding respiratory
movements as due to fatigue of the respiratory
apparatus. Increased partial pressure of carbonic
acid tends to the accumulation of carbonic acid in the
blood, and hence to the production of narcosis
without convulsions. Decreased partial pressure of
carbonic acid results merely in the carbonic acid of the
blood being able to leave the blood with greater
readiness. Alterations in the partial pressure of
nitrogen have no effect. Exposure to dessication
of the atmosphere or to concentrated carbonic
acid or oxygen are not affected.

Another point to attend to is the effect of variations
in external pressure, the proportional com-
position of the atmosphere remaining unchanged.
Reduced pressure will cause fatal convulsions, due to the sudden liberation of large quantities of the
inert gases in the blood and the air, these plug up the smaller vessels, and affect the
working of the valves of the heart, and cause
asphyxia. If the pressure be gradually diminished,
as in ascending a mountain, no effect even at con-
siderable heights is experienced beyond a feeling
of discomfort at breathing at the higher atmos-
phere. This is due to a derangement of the vascular
system, the walls being constructed to meet a
certain external pressure. If only the respiratory
interchange of gases were concerned, the total
external pressure might be reduced from 760 mm.
to 300 mm., corresponding to a partial pressure of
oxygen of 28 man. at altitude of 17,000
feet, before the combination of oxygen with
hemoglobin, at the temperature of the blood,
would be seriously affected. In various parts
of the world there are people living at an altitude
of 11,000 feet. If the pressure be still further reduced,
by the production of carbonic acid as that which results from absence of oxygen; the characteristic convulsions are often absent, while a rapid onset of feebleness amount-
ing almost to paralysis occurs. Increase of pressure
up to a pressure of several atmospheres is followed
only by symptoms of drowsiness, due probably to
increased pressure upon the whole organism rather
than to a direct derangement of respiration. At
a pressure of fifteen atmospheres, which corresponds
to a partial pressure of oxygen of three atmos-
pheres, the animal dies of asphyxia with convul-
sions as though from deficiencies of oxidative
power.
The production of carbonic acid is diminished with
increase of pressure—i.e. the oxidations of the
whole body are lessened. At a certain point these
oxidations cease, and the animal dies. All living
things are killed by a too great pressure of oxygen.
For the oxidations of some substances—e.g. phosphorus—are analogous; at a certain pressure
they will not burn.

The effect of variations in temperature must not be
overlooked. By variations in temperature we mean of course variations in the temperature of
the body and of the blood, and not the variations
in the temperature of the surrounding medium,
for these have normally, in warm-blooded animals
(the temperature of cold-blooded animals
varies with that of the surrounding medium),
no effect upon the temperature of the body, owing
to the regulating mechanism afforded by the
vessels of the skin and vaso-motor system (see
Circulation). The temperature of an Eskimo
is nearly the same as that of an African; and in a
Turkish bath the temperature only rises a very
little. In warm-blooded animals the chemical
processes of the body decrease with a
lowered temperature, and increase with increase of temperature; but the case is
with warm-blooded animals, for the temperature of the body in an atmosphere of low temperature is partly
kept up by increased oxidation i.e., by
the production of carbonic acid. If the temperature of the blood is actually raised
the chemical activity of the body of a
warm-blooded animal rises. Such an animal dies
when the temperature of its blood rises to 45° C.,
or 50° C., a nummul at 45° C., and a bird at 50° C.
Death is due to the fact that when the tempera-
ture rises to this point the partial pressure of
the oxygen of the air is no longer sufficient to main-
tain the combination of oxygen with hemoglobin.
Theoretically a higher temperature might be
survived if the external partial pressure of oxygen
were purposely increased.

INNER OR TISSUE RESPIRATION.—We now come to the last and most interesting part of our subject
—the manner in which the oxygen of the blood
enters the tissues, the use made of this oxygen by
the cells of the tissues finally resulting in the for-
mation and excretion of carbonic acid. As we have
seen, this carbonic acid leaves the tissues and enters the
blood. The term 'inner respiration' is by some
writers restricted to the interchange of the gases
between the tissues and the blood; but it is
usual and more convenient to include in that term
what is now being said at the higher modes of the
cells. We have spoken with confidence
of this respiratory action of all the cells of the

body, but we must not forget that it has not always been believed in, and even now is doubted by some. The original theory was that the oxygen was used, and the carbonic acid formed, in the lungs only. This was disproved when it was shown that there is more oxygen and less carbonic acid in the blood of a breathing man than in that of a sleeping man; it is the difference that going to them. Next it was, and still is by some, thought that the oxidations take place within the blood; the cells of the tissues were imagined as pouring oxidisable matters into the blood. Usually very little matter capable of taking oxygen is found in the blood, but in that of asphyxiated animals more of such matter was found; this was explained by supposing that in asphyxian the oxidisable excreta from the cells accumulated in the blood through insufficiency of oxygen; but it has recently been shown that this relieving stuff only exists in the red blood-cells—i.e. in the reduced haemoglobin—while lymph, which we might expect to find rich in such matters, is being eaten by them. Lastly, the supposition that the cells of the tissue take oxygen directly is so much in harmony with all our present ideas of animal physiology and with the facts of comparative respiration (one-celled animals breathe, and plants breathe, and in these there is no circuit of breath) that every one is likely to remain so for some time. All the food of a meal, or its equivalent, is in about six hours oxidised into carbonic acid, water, and urea. This is obvious without any elaborate calculations from the fact that we may observe that every one is likely to remain so for some time, while, apart from the indigestible parts of the food, which do not affect the problem, the chief matters that leave the body are those mentioned above. Yet food-stuffs outside the body are not affected by oxygen at the temperature of the body. Various suggestions as to the possible respiration of blood liberally have been made; but, since the phenomenon is obviously dependent upon the vital processes of cells, suggestions in terms of the principles of ordinary chemistry cannot carry us far.

Further information regarding respiration will be found in the various editions of the text-books of physiology recommended at the end of this article upon that subject. The diseases of the respiratory organs are dealt with in separate articles, BRONCHITIS, CONSUMPTION, PLEURISY, PNEUMONIA, TUBERCULOSIS.

Historically, William Harvey (384 B.C.) thought that the object of respiration was to cool the body. He observed that the warmer the animal the more rapid the breathing, and transposed cause and effect. Galen (131-203 A.D.) experimental on the mechanics of respiration and the functioning of the nervous mechanism. He believed that 'soot' and water were excreted from the body by the lungs. Malphighi (1661) described the structure of the lungs. Van Helmont (1664) discovered carbonic acid; Black (1757) observed that carbonic acid is breathed out of the body. Priestley (1774) discovered oxygen. Lavozier (1775) discovered nitrogen, found the composition of the air, and taught that the formation of carbonic acid and water resulted from the combustion that took place in the lungs. Vogel proved the existence of carbonic acid in the exhalation of the lungs and inhaled the former in arterial blood. Magnes extracted and analysed the gases of the blood in both states.

Comparative.—Most of the Protocora, all the sponges and stinging animals, and many simple worm-types live in water, which washes their surface and saturates their substance, the oxygen dissolved in the water serving the same purpose as that mixed with the air. While many worms breathe simply through their skin, many of the aquatic forms have structures specialised for respiration—mucous membranes, or nodules or muscular outgrowths of the body-wall. In Echinoderms respiration is effected by the tube-feet, and
sometimes by hollow "skin-gills" as well. The crustaceans usually breathe by gills or through the skin; in Peripatus, Myriopods, and insects air-tubes or tracheæ ramify throughout the body. Scorpions have plated sacs or "lung-books," which many regard as modifications of tracheæ; and these are sometimes placed in spiders also, without the addition of ordinary air-tubes. The king-crab has a unique arrangement, consisting of plated sacs or "gill-books," adapted for breathing in water. Some mollusce breathe simply by the skin, others have external gills, most have gills inside the mantle, appendages like snails have a mantle-cavity which serves as a lung. In Balanoglossus there are numerous respiratory clefts opening from the pharynx to the exterior; Appendicularia and young Tunicates have a pair of these; in adult Tunicates the primitive clefts are replaced by numerous secondary slits on the wall of the pharynx, through which water drawn in by the mouth passes into an atrial or peribranchial chamber and thence to the exterior; the same is true of Amphioxus. Clefts from the wall of the pharynx to the exterior are, indeed, characteristic of vertebrates, but beyond the amphibia they are transitory embryonic structures, never used for breathing. This loss of functional gill-clefts is associated partly with the development of an embryonic birth-robe known as the allantois, which secures the aeration of the embryo's blood, and partly with the transition from aquatic to terrestrial life. In the lungfish the nasal sac opens into the mouth; in fishes this is only true of the double-breathing Dipnoi; in all other vertebrates air passes through the nostrils in and out of the mouth and lungs. In the bag and lungfish there are paired gill-pockets, and the respiratory arrangements are otherwise peculiar. In fishes gill-filaments are borne on the skeletal arches separating the gill-clefts, and the blood-vessels spread out on the filaments are washed by currents of water. Young Elasmobranchs have at first external gills and afterwards the internal gills characteristic of all fishes. The Dipnoi have gills, but they also come to the surface and gulp air, using their air-bladder as a lung, and thus pointing the way to amphibians. For, while almost all amphibians have gills in their youth, all the adult air-breathers have lungs, though some retain their gills as well. Among higher vertebrates there are many peculiarities, such as the single lung of most serpents, the balloon-like air-sacs around the lungs of birds, and the adaptations of cetaceans as aquatic lung-breathers, but the essential characteristics of pulmonary respiration are the same in all. The hemoglobin, so important in respiration, occurs first in Nemer- teans, and is present in some other worms, some Echinodermata, a few Arthropods, some mollusces, all vertebrates except the Tunicates, Amphioxus, and a few exceptional fishes. But though hemoglobin is not present in most invertebrates, analogous pigments are common, especially hemocyanin, which turns bluish when oxidised.

Artificial Respiration.—When death is imminent owing to a cessation of the natural respiration movements, it may sometimes be averted by an imitation of them carried out for some time. Such a condition may occur in disease (e.g. epilepsy), though very rarely; it is most common in suffocation, either by drowning, choking, or strangulation, and is sometimes met with also in poisoning by noxious vapours (e.g. carbonic acid, carbonic oxide, coal-gas, chloroform, &c.).

In order that any method may have a chance of being successful it is of course necessary that the entrance of air into the lungs be not impeded, either by a piece of food or by water in the wind-pipe, or by the tongue falling back and closing the upper opening. A piece of food may sometimes be removed through the mouth by the finger; if this fails the wind-pipe should be opened (see Tracheotomy). In these apparently drowned the body should first be laid on the face, with the head low, and the thorax and abdomen pressed upon in order to expel fluids which may have been drawn into the tracheæ and bronchial tubes. The tongue may need to be held forward; this may be done by an assistant, or an elastic band passed round the tongue and the chin will effect the object.

Numerous different methods have been devised for effecting the objects aimed at, and no general consensus of opinion has yet been arrived at as to which is the best. The methods fall into three divisions: (1) insufflation, or blowing of air into the lungs, either by the mouth or by means of bellows; (2) manual methods, in which external manipulations of the chest-walls are made to effect the entrance and exit of air; (3) electrical stimulation of the respiratory muscles. In all cases where artificial respiration is required every moment is of importance. It is doubtful whether life can ever be restored when the heart has ceased to beat for more than a few seconds; and when breathing has stopped failure of the heart's action is always imminent. That method is therefore best which can be applied with the least possible loss of time, so that under ordinary circumstances the methods which require bellows or electric batteries are out of the question. Direct insufflation, or blowing of air into the patient's lungs by the mouth applied to his mouth, is now hardly ever used except in the case of very young children. Of the manual methods those most in use are Marshall Hall's (1856), Silvester's (1857), and Howard's (1877). The second is certainly the most easy to learn, but is more fatiguing to carry out for a length of time than either of the others. In Marshall Hall's method the body is laid upon its face and rolled 'in what may be termed erable fashion' from this position on to one side and a little beyond it (inspiration), and then back on to the face (expiration). In Silvester's method the
patient is laid on his back on a plane, inclined a little from the feet upwards, and the shoulders are gently raised by a firm cushion placed under them, which also throws the head back. The operator then grasps the patient's arms just above the elbows, and raises them till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down, and the chest-wall, or, as it is termed, the within half of the chest. A deep expiration is thus imitated. In Howard's method the patient is laid on his back with a cushion below the middle. The operator kneads astride his hips, places his hands with fingers spread outwards over the chest-wall, and alternately bends forward, throwing his weight on the chest to imitate expiration, and springs back to allow the elastic recoil of the chest-wall to imitate inspiration.

Whatever method be adopted, the movements must be gently, regularly, and perseveringly carried on, at the rate of from ten to fifteen times in the minute; and when the faintest natural effort at respiration is observed they must at once be tim ed so as to reinforce and not to oppose it. In some cases life has been restored under artificial respiration when all that has been done before has failed. In all cases, but especially in that of persons apparently drowned, artificial respiration should be conducted in a warm atmosphere, 90° F., or even more if possible, and should be supplemented by warmth applied to the extremities. In many species of animals artificial respiration can be continued for an hour or even several hours. If stunning or fainting has occurred at the moment of immersion, so that the respiratory movements have been annulled or much diminished for the time, less water is required, and the chance of recovery may be greater. In other modes of death by suffocation, such as choking or strangulation, the action of the heart may continue longer, and restoration to life be therefore possible after a longer deprivation of air.

See the publications of the Royal Humane Society and Royal National Lifeboat Institution; various handbooks on ambulance work. A résumé and discussion of the various methods is given by Dr. B. W. Richardson in the American Journal of the Medical Sciences, for 1857.

**Respirators** are worn over the mouth (oral) or mouth and nose (ori-nasal) for changing the properties of the air inspired. The name was first given by Mr. Jeffreys to an apparatus he contrived about 1835 for the purpose of warming the air, formed of numerous layers of fine perforated metal with wire soldered to them. Their value in diminishing the risk of catching cold, which in many cases is undoubted, probably depends at least in part on their affording protection to a sensitive portion of the skin; they act, in fact, as an additional article of clothing. But they are of most value to those who are not able to breathe through the nose in the natural way. Respirators have been largely used of late years in diseases of the nose, throat, lungs, &c. for improving the inspired air with medicated vapours; for this purpose construction of a small chamber containing a sponge or cotton-wool which is kept charged with the substance whose action is desired (carbolic acid, cresote, eucalyptus, or pine oil, &c.). Respirators have been also devised for freeing the inspired air of impurities—e.g. in the case of firearms they have come into an atmosphere strongly charged with smoke; of needle-grinders and others whose work gives rise to much irritating dust; of those who are exposed to foul gases, &c. See Filter.

**Respite,** a temporary delay of the execution of a criminal. See REPRIEVE.

**Responsor** is a loan raised by the master of a ship, when he has no other means of doing so, upon security of the cargo or goods on board the ship. The contract has reference to a particular voyage, and the conditions are that if the subject on which the money is advanced be lost by sea, risk, or superior force of the enemy the lender shall lose his money; and that if the goods arrive in safety the lender must be paid the value of the goods, plus the rate of interest, called marine interest. When the ship herself is hypothecated the contract is called Bottomy (q.v.). As a matter of fact the term responsor is now seldom used, and generally the expression bottomy is employed whether the vessel or her cargo is put to loss by the enemy.

**Responsibility.** See INSANITY, INFANT, HUSBAND AND WIFE, EVIDENCE, CAPACITY (LEGAL), LIABILITY.

**Responsions.** See OXFORD, Vol. VII. p. 682.

**Rest-harrow** (Ononis), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceae, having a 5-cleft bell-shaped calyx, the standard of the corolla large and striated, the keel beaked, the pod turgid and few-seeded. There are many species of Rest-harrow, of which some are gener ally herbaceous or half-shrubby. The Common Rest-harrow (O. arvensis) is abundant in pastures and by waysides in Britain. Its lower leaves have three leaflets, the upper are simple; the flowers are axillary and rose-coloured, or occasionally white. The plant is half-shrubby, with somewhat spiny stems; viscid; and its smell strong and unpleasant. The roots are tough and woody, whence its English name. It is sometimes a troublesome weed, but only in neglected pastures, and disappears after careful cultivation.

**Restiaceae,** a natural order of plants, nearly allied to Cyperaceae, but the Cyperaceous tribes are of the southern hemisphere, and abounding at the Cape of Good Hope and in Australia. They are herbaceous plants, or sometimes half-shrubby, with simple stems and narrow leaves, and are hard, wiry, and rush-like. They have generally a creeping root-stock.

**Restigouche,** a river of Canada, rises in eastern Quebec, flows south-east into New Brunswick, then east and north-east into the Bay of Chaleurs, forming part of the boundary between the two provinces. Its length is about 200 miles.

**Restoration,** the resumption of monarchical government on the return of Charles II. to his kingdom, May 29, 1660. A form of prayer for that day was annexed to the Common Prayer-book from then until 1859; and, in commemoration of Bossucl (q.v.), 'Oak-apple Day' was long also celebrated by the displaying and wearing of branches and sprigs of oak, with gilded oak-apples.

**Restoration,** in its true sense, means bringing back or replacing what has gone; but of late years the word has been given a new meaning. Restoration now means making new imitative work to take the place of decayed or fractured work, and in this sense it applies to pictures, sculpture, furniture, and architecture; but as applied to architecture it is allowed a still wider meaning—viz. the building up anew and with new materials portions of buildings which have ceased to exist, such new work being designed afresh in imitation of what was supposed once to have existed. The new meaning of the word restoration only applies to works of art, including all the decorative arts. The 'restoration' of pictures and sculptures has long ago been condemned as diminishing the value of such works of art. For instance, at the British Museum and other public galleries it used to be the custom to employ a sculptor to
Sir Gilbert Scott was the most noted. Into his hands was placed nearly every cathedral church in England, as well as a countless number of parish churches, and the finishing touches of the great works of the elder Pugin. Long before his death a cry of discontent arose. Even those who had felt that it might be possible to imitate the medieval work accurately, so as to replace missing features, saw that this was a hopeless task, for not a single successful example of 'restoration' had been pointed to.

Ruskin wrote strongly against 'restoration,' urging the folly of attempting to reproduce a lost work of art or any portion of it, and giving it as his opinion that the only right method of treating our ancient buildings—such indeed as had not been destroyed by the building of new structures or of removing old features, by propping leaning walls and mending leaky roofs. His words did but sound the note which was in the minds of many, and in 1877 a society was formed in London calling itself the Society for the Protection of Ancient Buildings, and of the architects, artists, and many professions, including the clergy. This society has done its best to point out to those who still believe in the possibility of 'restoration' the destructive character of such work—destructive both of works of art and historical evidences—and it has urged the importance of keeping our ancient buildings in thorough and constant repair so as to avoid the necessity of wholesale renewal or rebuilding. The society also urges that no purely ornamental feature should ever be renewed any more than the antique statue should have its missing features replaced, and that where new features have of necessity to be introduced every effort should be made to keep them harmonious with, but dissimilar from, the ancient work. As examples of 'restoration' works we may give the north transept of Westminster Abbey and the west side of Westminster Hall, nearly the whole of St. Alban's Abbey, the west front of Salisbury Cathedral (where an attempt has even been made to produce medieval sculpture), Chester Cathedral, Worcester Cathedral; and, in fact, not a cathedral remains in England that does not bear marks of the movement. As has been shown, the restoration of ancient buildings has been, in some cases, so thorough that it has met a check, and shows signs of dying out; although it has spread to Scotland, the Continent, and even to India. Fortunately government has put a check upon it there, and we may hope that restoration as understood by the school of Sir Gilbert Scott will henceforward be practically abolished.

Restoration of Pictures. The restoration and the cleaning of pictures may be considered together: though cleaning, of course, more strictly applies to the removal from their surface of the accretions of dust or discoloured varnish which obscure their beauty, while restoration refers to the replacement of actual flaws in their surfaces. Thus, paint, or in the canvas or wood upon which the paint is laid. When a musty varnish has been used by the painter, and has become discoloured and opaque, it may be removed by careful and gentle friction with the points of the fingers, previously covered with a resins powder, which frays off particles of the hardened coating in the form of a fine white dust. When copal varnish has been applied, its removal is more difficult and dangerous, and is usually effected by an application of weak alcohol, spirits of turpentine, and oil. A paste made from wool is applied, and the varnish dissolved in it, and passed over the surface of the varnish, which it dissolves and removes; a similar pad steeped in pure oil being applied at intervals to stop the action of the spirit when it threatens to disturb the colour beneath the varnish. When portions of the paint or of the ground of priming upon which it has been laid have been removed,

Rev. the time restoration therefore usually; will Westcott's the The also canvas on so examining, its the they practice ironed, and the ironed, a process which has the effect of restoring evenness to a cracked surface of paint; though if the artist has worked with a thick impasto the raised points of colour are apt to become flattened, and afterwards ironed, which has the effect of restoring the paint to its original state. When a fresco has been removed from a wall this is usually effected by pasting its surface on paper, and then with a chisel slowly detaching the mortar which bears the colour from the stones upon which it has been laid, each portion, as it is gradually withdrawn from the building, being called on a large cylinder. All the operations to which we have referred require extreme caution and great practice for their successful accomplishment. When they are entrusted to careless and untrained hands damage is certain, and it is impossible to estimate the amount of injury to works of art that has been effected by ignorant picture-restorers.

Proper care of a picture, however, and preservation from damp and dust, will obviate the necessity for its being subjected to restoration; and such precautions are the best of all, and the best of all to prevent the closing in its back, and by covering its surface with glass, which answers all, and more than all, the preservative purpose of varnish, with the additional advantage that it does not chill and discolour with time. Glass is being largely adopted in the great public galleries, for covering existing pictures, and it has only one disadvantage—its tendency to reflect the objects placed opposite it, and so to interfere with the ready and complete examination, as a connected whole, of the entire surface of a large, and especially of a dark, painting.

Restorationists, a general name for those who hold the belief in a general apocatastasis, or restoration of all things, in which, after a purgation by pasto or glue, to a new canvas, and afterwards ironing, a process which has the effect of restoring evenness to a cracked surface of paint; though if the artist has worked with a thick impasto the raised points of colour are apt to become flattened, and afterwards ironed, which has the effect of restoring the paint to its original state. Resurrection. This expression denotes the revival of the human body in a future state after it has been consigned to the grave. We find traces of this doctrine in other religions, in Zoroastrianism, and especially in later Judaism, but it is not known to occur in Christian literature until the 16th century. In the earlier Hebrew Scriptures there is no mention of it. It is not to be found in the Pentateuch, in the Psalms, nor even in the earlier prophecies. It is supposed to be alluded to in Isaiah (xxvi. 19), and in Ezekiel (xxxvii.) in the well-known chapter as to the revival of dry bones in the valley of vision; and in the last chapter of Daniel (xii. 2) there is the distinct affirmation that 'many that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt. There is also a well-known passage in Job (xix. 25-27) which was long thought to refer to the doctrine of the resurrection of the body; but all recent critics deny the validity of this reference. It is thought to be an allusion to the statement that the doctrine appears, and it is sometimes said, doubtfully, to have been derived from Persia or elsewhere. In the time of our Lord it had become a formal doctrine of the Pharisees. The general body of the Jewish people seem also to have believed in it; the Sadducees alone disputed it. It appears, in fact, to have become bound up in the Jewish mind with the idea of a future life, so that an argument which proved the one proved the other. It should be added that, Mohammedanism (q.v.) cherishes gross beliefs on this head.

It remained for Christ and His apostles to reveal clearly the doctrine of the resurrection of the body, and to connect it with the fact of Christ's own resurrection as its special evidence and pledge. The following arguments are involved in the doctrine as revealed in the New Testament: (1) The resurrection of the dead is ascribed to Christ Himself; it will complete His work of redemption for the human race (John v. 21); Cor. xv. 22 sq.; 1 Thess. iv. 14; Rev. i. 18). (2) All the dead will be raised in the last day to receive judgment according to their works, 'they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation' (John v. 21-29; 1 Cor. xv. 22; Rev. xx. 11). (3) The resurrection will take place at 'the last hour,' by which seems to be meant the close of the present world (John vi. 39, 40, xi. 24; 1 Thess. iv. 15). (4) The great event is represented as being ushered in by the sound of a trumpet, a representation probably borrowed from the Jewish worship, as the sounding of the trump in the sound of trumpet (1 Cor. xv. 52; 1 Thess. iv. 16). (5) As to the character of the change through which our bodies are raised after the lapse of ages, and yet retain their identity preserved, there is nothing distinctly made known. The possibility of such a change was evidently a subject of argument in the primitive Christian age, and the apostle argues strongly in its favour (1 Cor. xv. 22 sq.) from occurrences which are scarcely less mysterious in the natural world.

The Gnostics denied the resurrection of the body, and made the change a purely spiritual one. The Catholic belief was greatly developed by Tertullian, Jerome, and Augustine, who, however, insisted that the resurrection body, though identical with the original one, is a glorified body. A third view, represented by Origen at an early date and by Modestus of Emesa, and especially by Rothe, affirms that the spirit must always have a bodily organism, and that the perfected personality necessarily assumes a spiritualised embodiment; in this view resurrection is limited to perfected spirits.

See also the articles IMMORTALITY, CONDITIONAL IMMORALITY; also those on HEAVEN and HELL. There is a full bibliography in Alger's History of the Doctrine of the Future Life (Phila, 1864); see also the Excurseus in Geddes's Commentary on St John; Westminster Gospel of the Resurrection (1866; 5th ed. 1884); and Masen's essay on the Resurrection of Jesus Christ (1877).

Resurrectionists, or Body-snatchers, the names popularly given to those who made it their business to dig corpses out of their graves and sell
them as 'subjects' to lecturers on anatomy. Gradual progress in the science of anatomy led to its more thorough study by greatly increased numbers, and it is ordered that all the males of the 18th century professors of anatomy found that the supply of subjects, heretofore mainly obtained from the bodies of executed criminals, was altogether inadequate to meet the wants of the surgical and medical schools. The resurrectionists invented two systems to supply the lack, and in the first quarter of the 19th century drove a most flourishing trade—the graveyards in the outlying parts of London being especially the happy hunting-grounds of the confraternity. As the business became organised, grave-diggers and sextons were bribed to remove gravesyards unlocked and keep out of the way when a body was being raised. A very short time, usually at dead of night, sufficed; an expert pair of resurrectionists being able in about forty-five minutes to prise up the coffin out of a newly-made grave by means of a peculiar crowbar for the purpose, to burst in the lid, and remove the corpse. Corpses reanimated after this fashion seem to have been worth £8 or £10—offering large profits and quick returns to this precarious and risky trade. The body-snatchers carefully replaced the clothing in the coffin; the stealers resold corpses, and for the latter in England a misdemeanour only, whereas the removal of the clothes was of course a felony, punishable by transportation. So notorious did the practice of resurrectionism become that in many parts of the country painful precautions against it were regularly taken; heavy gratings were securely fixed over new-made graves, spring-guns were set, and often the relatives of deceased persons sat armed by their graves night after night until it was assumed that the corpses would be no longer serviceable to 'the doctors'—a custom that survives to this day. Hiding-masters or towers were sometimes built for the accommodation of the watchers. To the popular horror of this degraded calling, recruited from the worst classes, was added a strong suspicion that resurrectionists would on occasion murder—a suspicion based in the notorious case of Burke and Hare (see Burke, William). The passing of the Anatomy Acts of 1832 and 1871 rendered the lucrative trade of the resurrectionist superfluous; but in out-of-the-way places there are still traces of the old terror of bodies being secretly disposed of. (q.v.)

Retainer is, in English law, the act of engaging an attorney or counsel to attend to a certain suit or cause. The retainer of an attorney may be either verbal or in writing; but the retainer of counsel is usually by written memorandum handed to his clerk, together with a small retaining fee. A general retainer is given by a party who wishes to secure the services of counsel in all actions brought by or against him, and is also used to denote the right of an executor to retain a debt due to himself from his testator's estate.

Reford, East, a market-town of Nottinghamshire, on the right bank of the Idle, an affluent of the Trent, 24 miles E. by S. of Sheffield and 138 NNW. of London by the Great Northern Railway. It has a handsome town-hall (1867), a grammar-school (1552; rebuilt 1858), paper-mills, iron-foundries, &c. It was first formally incorporated by James I., the municipal boundary being extended in 1878. The parliamentary borough was extended in 1829 to take in the whole parliamentary area of the town. See also Reford

Retina, see Eye.

Retinophora. See Cypress.

Retirement of officers from the British army is governed by royal warrants issued from time to time. As a rule, the 22nd century offers officers to retire voluntarily with gratuities or pensions, and oblige them to retire at certain ages, or after a period of non-employment, on half-pay. Voluntary retirement on a gratuity of £1200 is allowed to officers other than those of the Indian Staff Corps, the Royal Engineers, the Royal Milta Fusilier Artillery, Riding-masters and Quartermasters (q.v.), after twelve years' service, and to others on a pension according to rank and service. With certain modifications, the maximum rates are: £150 a year, for lieutenants, £700; £250 for major, £800 to £1300; £170 to £250 for lieutenant-colonels and colonels, sixty-two for major-generals, and sixty-seven for lieutenant-generals and generals. Non-employment for five years in any rank also entails retirement. Officers of the Indian Staff Corps and captains of the Royal Engineers do not come under these rules. The pensions granted in cases of retirement for age are, generally speaking, £50 more than those cited above, but for the three ranks of general officers they are £600 to £700, £750 to £850, and £900 to £1000 according to age. Certain additions, generally in the form of gratuities, are allowed to purchase officers and officers of the late East India Company's Artillery and Engineers, in consideration of their service. The officers of the Coast Artillery of the Indian Staff Corps are subject to regulations laid down from time to time by the Secretary of State for India. They are considerably larger in amount than those granted to the other branches of the service, and are affected by numerous rules. In full uniform, more than half a pension can be earned by less than twenty years' service. Officers of the Coast Brigade Royal Artillery and
Coast Battalion Royal Engineers, inspectors of army schools, riding-masters, and quartermasters can earn a maximum pension of £200 a year, or the two first-mentioned classes if retired for age (five-five years) may receive the full pay of their rank.

For the Royal Malta Fencible Artillery the maximum rates of retired pay are: captains, £200 a year; majors, £200; lieutenant-colonels or colonels, £365.

Departmental officers receive retired pay at rates corresponding to those granted to other officers and on similar conditions as to age. Some of the highest rates are chaplain-general, £600; commissary-general, £800; director-general, Medical Staff, £1125.

The army estimates for 1891-92 provide for a total of £1,883,652 on account of retired pay and gratuities (£1,543,950), half-pay (£73,530), allowances to widows, &c. (£164,563), rewards for distinguished services (£12,400), pensions for wounds (£15,200) for officers; for warrant officers and non-commissioned officers, £1,856,207. In 1896-99 the corresponding figures were £1,938,206 for officers, and £1,802,335 for warrant officers, &c.

In the navy officers are placed on the retired list at sixty-five years of age if admirals or vice-admirals, sixty for rear-admirals, fifty-five for captains, fifty for commanders, and forty-five for lieutenants, with the option in each case of retiring five years earlier. Lieutenants and commanders are also retired compulsorily if they have not served for five years afloat, captains after seven years without service, and flag-officers after ten years. In 1891-98 there were some 2300 naval and marine officers on the retired list, costing about £790,000 a year. See PENSIONS, DISCHARGE.

**Retort**, a vessel employed by chemists for the purpose of distilling or effecting decomposition by the aid of heat. It may be made of glass, earthenware, or metal, according to the purposes for which it is to be employed. Glass retorts are the most common, and their ordinary form is seen in the figure. They may be employed for the production of such products as do not require any extraordinary degree of cold for the condensation of their vapour—as, for instance, for the production of hydrocyanic or nitric acid. The globular vessel in which the neck of the retort is inserted is from its function termed the receiver. Cold may be applied to the neck of the retort—for the purpose of condensing the vapour—in various ways, as by the application of a cold wet cloth, by a current of water, or by a special apparatus known as Liebig's Condenser, shown in the figure at BB.

In ordinary cases requiring a higher temperature than glass could bear earthen retorts are used; for the preparation of hydrochloric acid retorts of lead are employed; while for the preparation of sulphuric acid platinum is the best material for the retort. Iron retorts are employed in the laboratory for the preparation of oxygen from black oxide of manganese and some other processes, and in gas-works for the destructive distillation of coal. See DISTILLATION.

**Retours.** See RECORDS (Scotland).

**Retreat**, a period of retirement to a religious house, for self-examination, meditation, and prayer. Retreats commonly last either three or seven days, and are conducted by a cleric, who delivers addresses daily. They are in use both in the Roman and, among the High Church party, in the Anglican Church.

**Retriever.** As the name implies, the retriever is a breed of dog trained to find out and bring back any killed or wounded game. The work of the retriever was long done by various breeds of dogs, such as the pointer, setter, or spaniel, but, in addition to it spoiling these dogs for their regular work, they have resulted in the worst fault possible in a retriever, as he wastes more in game injured than would have been lost without him. Crosses with the Newfoundland were tried, and gradually two kinds of retriever were introduced. One variety, known as wavy-coated, was probably the result of a cross with the setter; and the other, known as curly-coated, is from the water-spaniel or poodle. Not much attention was paid to the retriever until the introduction of dog shows, about 1850, but since that time the breed has been kept free from any fresh cross, with a great improvement in the appearance. The two varieties of retriever differ only in coat; the curly coat should curl closely and firmly all over the body, the wavy coat should fall straight and thick. An intelligent large head, with a full clear eye, should always be seen in the retriever. Legs and feet need to be large and strong. The retriever should not be too small, as it needs a powerful dog to retrieve a bare successfully. The retriever makes a very good watch-dog, and numberless bad specimens of the breed are to be found fulfilling this unseasonable task. The pure retriever is gentle in temper and easy to command.

**Retrograde,** in Astronomy, a term applied to the motion (real or apparent) of a celestial body when that is opposite in direction to the yearly course of the sun from west to east. The superior Planets (q.v.) retrograde when in opposition (see CONJUNCTION). As their motion is then nearly parallel to the earth's, they moving more slowly than it, appear to fall behind for a time. This period of retrogradation is of course longer for the planets whose motion is slower, and less for those whose speed more nearly approaches that of the earth. The inferior planets, which move faster than the earth, retrograde when in inferior conjunction. Their course being then nearly parallel to the earth's, they gain upon it, and appear to pass the sun from east to west. Thus Venus, when nearing the end of her appearance as an evening star, descends each night nearer to the western horizon, until so near the sun as to be lost in his rays. Passing then to his west side, the planet reappears as a morning star.

**Retz, Jean François Paul de Gondi, Cardinal de,** born at Montmirail in 1614, of a family originally Italian, that had acquired great estates in Brittany and formed connections with the noblest families of France. His uncle was Archbishop of Paris, and he was early destined for the church in spite of amours, duels, and every
form of clerical behaviour. A friend reproaching him with his debts, "Cæsar," said the splendidly young man, "pay me as much as I do." Retz was entangled in political intrigues from his childhood up, even under the watchful eye of Richelieu, and, having at length in 1643 obtained the counterpoise with reversion of the archbishopric of Paris, he skillfully used the position for personal objects devoted to himself. He plotted actively against Mazarin, and was one of the main instigators of the outbreak of the Fronde in October 1648. During the next four years he rose and fell with those of fortune. In 1702, when he was flung into prison, first at Vincennes, then at Nantes. After two years he made his escape, wandered in Spain and England, appeared at Rome—where, it is said, he secured the election of Pope Alexander VII.; and at length in 1662 made his peace with Louis XIV. by resigning finally his claim to the archiepiscopal in exchange for the abbacy of St Denis and restoration to his other benefices, with arcars. He spent the rest of his life mainly in quiet at Paris, at Commercy, and St Mihiel in Lorraine. His enormous debts, reaching to four millions of francs, his peculiarity of having three successive masters, called to him, for his creditors, making over to them his whole income save 20,000 livres. He died at Paris, 24th August 1679.

Retz was connected by marriage with Madame de Sévigné, and figures in a perhaps too pleasant light in her delightful letters. His Mémoires, coming down but till 1655, throws much light on the dark and troubled intrigues of the Fronde, and displays quite remarkable skill in narrative and elaborate character-drawing. His own character has been sketched with faithful, if unkindly, truth by his great antagonist, La Rochefoucauld, and the sum of the whole is contained in the words: 'He has raised up the greatest disorders in the state without having formed any plan how to profit by them.'

The earliest edition of his masterpiece in a kind peculiar to French literature appeared at Nancy in 1717, but the first adequate edition was for ever lost. It was in the 3 vol. of Micheaud and Pouyat's collection (Paris, 1836). Later and better editions are by Gérard (1844) and Champollion-Figeac (1859); but the best is that in the series called Miscellanea Francisci, of which four editions have been printed by A. Le Guillot, and at Chatelaine (10 vols. L-x, 1872-88). See works by Carney (2 vols. 1863), Topin (31 ed. 1872), Chatelaine (3 vols. 1877-87), and Gazer (1877). - R. H. S.

Retz, HANS, or RAUZ, GILLES DE, a 15th-century monk of iniquity, was a licentiate of high rank and family connections, who distinguished himself under Charles VII. in the struggle with the English, by fighting by the side of the Maid of Orléans, and bearing the alms-bowl at the coronation of the king. He was made marshal of France in 1430, and soon after, in 1432, was made bishopric of Chartres. Retz, who has been accused of having indulged in the most infamous orgies, having kipampioned or enticed to his castle as many as 150 children, who were sacrificed as victims to his unnatural lusts or his sorceries. He was at length hanged and burned at Nantes in 1446, and then, after a closed by the church conference. It should be noted that the whole story is by no means free from suspicion, and, moreover, that both the Bishop of Nantes and the Duke of Brittany were active personal enemies of Retz. Attempts have been made to find in him an historical original for 'Blanche!' by persons ignorant of the world-wide diffusion of stories of forbidden chambers and punishments for curiosity. See Haringe Gould's Book of Wore-Wolves (1865).

Retsch, FRIEDRICH AUGUST MORITZ, painter and engraver, was born in Dresden, 9th December 1779, and studied at the academy of his native city, where he was a professor in 1824. He died 11th June 1857. He has acquired great celebrity by his etchings in outline of Schiller and Goethe—those of Goethe's Faust being particularly well known—Fonque's tales, and Shakespeare. His masterpiece is 'The Chess-players' ('Man against Satan'). Retzsch was a Master of Art in 1828.

Reuchlin, JOHANN, also known by his Greek name of CAMPUS, humanist and one of the first promoters of Hebrew studies in Germany, was born at Pforzheim in the Black Forest, 28th December 1455. He received his earliest education at Schlettstadt, and in 1473 was appointed travelling companion to Prince Francis, of whose capacity he visited Paris, where he studied Greek under Hermogenes of Sparta, besides assiduously practising the composition of Latin. Two years later Reuchlin went to Basel, where he continued his study of Greek, and wrote his Latin dictionary, Vocabularium Breviscopum (1476). In the same year he paid a second visit to France, studied law at Orleans (1478) and at Poitiers, then, returning to Germany (1481), set up as lecturer at Tübingen. In 1482 and again in 1490 he was in Italy on the business of Duke Eberhard; in 1489 we find him at Basle, and in 1502 at Innsbruck. In 1506 he had a dispute with D. J. Lollard, the imperial physician. In 1496 Reuchlin went to Heidelberg, where he became the main promoter of Greek studies in Germany, though not a public lecturer. In 1498 he was sent to Rome by Philip the Elector-palatine, and applied himself more vigorously than ever to the study of Hebrew and Greek. Reuchlin returned to Stuttgart in 1499, and in 1500 obtained a judicial appointment. In 1506 appeared his Rudimenta Lingae Hebraicae. His Hebraic studies, which embraced the post-biblical Jewish literature, were drawing him into intimate struggle with learned Jews, Jewish promoters, and the Dominicans, and directly and powerfully helping on the Reformation. It was in 1510 that Johann Pfeifferkorn, a Jewish proselyte, in the true spirit of a renegade, called upon princes and subjects to persecute the religion of his fathers, and especially urged this upon the emperor and his court. Books except the Bible. Reuchlin remonstrated, maintaining that no Jewish books should be destroyed except those directly written against Christianity. This tolerant attitude drew upon Reuchlin the enmity of the Dominicans, and particularly the inquisitor. In 1513 at Heidelberg, where these prophecies of Reuchlin held possession of the universities of Paris, Louvain, Erfurt, and Mainz; but all the distinguished and independent thinkers in Germany were on the side of the brave and humane scholar. Among the Reuchlinists we may especially mention the names of Ulrich von Hutten (q.v.) and Franz von Sickingen (q.v.); and to this controversy we owe the Epistolae Observatorum Virorum (q.v.). A quarrel broke out between Ulrich Duke of Württemberg and the Swabian League, in the course of which Reuchlin became a prisoner of Duke Wilhelm of Bavaria, however, in 1516 appointed him professor at the university of Ingolstadt. In 1522 the plague broke out at Ingolstadt, and Reuchlin taught once more for a term at Tübingen, but soon after fell sick and died at Liebenzell, near Hirschau, on the 30th of June.

Reumont, ALFRED VON, a German historian, was born at Aix-in-Chapelle on 15th August 1806, and died there on 27th April 1887, having from
Reunion, formerly called Ile de Bourbon, an island belonging to France, and lying in the Indian Ocean, 115 miles SW. from Mauritius and 330 E. from Madagascar. An ellipse in shape, it has an area of 764 sq. m., being 58 miles in length and 28 in breadth. It has an estimated population of 33,000 negroes and nearly 30,000 natives of India. The backbone of the island is a volcanic range, culminating in two highest peaks, the Piton de Neiges (10,696 feet) in the centre of the island, and in the south-east Piton de Fournaise (3612 feet), one of the most active volcanoes in the world. The central parts of the island between these volcanic peaks consist of plateaux and terraces, separated by deep cauldron-shaped valleys and narrow, but profound, gorges and ravines. Piton de Fournaise is surrounded by a vast dark forest, reserved the Pays Bois ("Primeval Land"). Except in the mountainous parts the soil is in general very fruitful. The scenery is often beautiful. Streams, although not large, are very numerous, and fall in cascades to the sea. The chief rivers of each state are called the Gathy. Rainfall averages 45 inches in the year. Cyclones sometimes occur during the hotter and rainiest part of the year (November to April), and high springs- tides occasionally do serious damage during the remaining drier months. One-third of the island is cultivated, one-third is forest, and one-sixth is grass-land. Tropical fruits, sugar (the staple crop), coffee, vanilla, cinchona, maize, vegetables (potatoes, &c.), spices, tobacco, and similar products are grown. The total trade is estimated at £1 million sterling—exports, £550,000; imports, £700,000 to £900,000. By far the most important of the export goods is sugar (£140,000); coffee, vanilla, rum, potatoes, and tapioca are the other chief exports. The imports consist principally of rice, cotton, and in a secondary degree barley, live cattle, fish, grains, oil, eggs, flour, and cloth. The capital of the island is St Denis, and the chief port of the island is Salazie, with warm mineral springs, a health-resort of 6000 inhabitants. The coast towns are connected by a railway 78 miles long. The colony costs France some £170,000 every year, and is administered by a governor and a council of thirty members. Reunion and Mauritius were discovered by the Portuguese navigator, Masearenhas, and named after him the Masearen Isles. The French took possession of this island in 1648, and called it Island of Bourbon, which was afterwards changed to Reunion, and to Isle Bonaparte in 1809. Reunion has been the official name since 1848. The island was in the possession of the French from 1810 to 1815.

See Bory de St Vincent, Voyages (1804); Maillard, Note sur la Reunion (1862); Roussel, 1'ile de la Reunion (4 vol. 1860); and W. J. Oliver, Crois et Cratres: Ramble in Reunion (1897).

Reuss, a town of Spain, 58 miles by rail SW. of Barcelona and 4 N. of its seaport, Salou. The prosperity of the place dates from about 1750, when a number of English merchants settled there. It is a busy centre of the cotton, silk, and silk ribbon industries, including all kinds of manufactures soap, brandy, and leather. Pop. 27,503.

Reuss, a tributary of the Aar in Switzerland, rises on the northern face of the St Gothard, flows northwards past Andermatt and Amsteg, between which places its bed lies at the bottom of a wild and narrow gorges, and by great precipices and other wonders of Swiss roadmaking, and enters the southern end of the Lake of Lucerne. This it leaves again at its northern end, at the town of Lucerne, and, still going due north, reaches the Aar near Windisch (Aargau). Its length is 90 miles; its basin 1317 sq. m.
stomach created in him an abnormal craving for strong drink, which he never conquered. It was eleven years more before he settled down to his life's work. Meanwhile, his income, 1727, in the meantime turned his back upon him as a good-for-nothing, he tried to resume his legal studies, learned farming, taught pupils, but lived chiefly on the kindness of a friend and on a small annuity left him by his father, who died in 1843. Reuter began to write again in High German; but having turned them into rough verse form, in Low German, the jokes and merry tales of the countryside, he published them—Lauschen um Rînelis (1838; 18th ed. 1889), and the book became at once a great favourite with all who spoke and read Low German. Two years later he wrote an equally successful Low German poem, Heis'nah Beldgen (12th ed. 1884), describing in broad humorous fashion the journey of certain peasants to Belgium in search of culture. The next seven years (1856–63), passed at Neubrandenburg, were the period in which he wrote his greatest books. The first of these was a second volume of Lauschen um Rînelis (1855; 15th ed. 1889), and the deeply tragic poem Kein Hüung (1858; 11th ed. 1901), picturing the wretchedness of the semi-serfs on the great Mecklenburg domains. The rest, except Heine Nute (1856), a pendant to 1844, a poetic novel in which birds prominently as speaking characters, were all written in prose in Low German (Platt-Deutsch), and were published under the general title of Olette Kamellen, which may be given in English as Old-time Stories. These books, more especially the latter, 17th ed. 1883; Eng. trans. as The Year '73, 1873), Ut mine Festungstîl (1862; 15th ed. 1901), and his masterpiece, Ut mine Stromlit (1862–64; 17th ed. 1901), spread Reuter's fame abroad through all Germany, and lifted him to the proud position of Germany's greatest humorist next to Jean Paul; as a literary artist he ranks in many respects above Jean Paul. These tales have the indubitable flavour of real life: they deal with the characters and doings of rural Mecklenburg, are told with the verve of the born story-teller, and are leavened in the purest and most charming style of his native language. Reuter is master of a tender pathos. Uncle Brissig in Stromlit is one of the greatest creations of German literature. The best witness to Reuter's own character is the history he wrote (Ut mine Festungstîl), particularly as he appeared in prison; the book has not one word of bitterness or a single trace of revengeful feeling throughout; good-nature and humour are its dominant notes. Besides the works quoted, Reuter also wrote Schurri Mur (1861; 11th ed. 1886), sketches of country life, partly autobiographical; Doroishuutschig (1866; 11th ed. 1886), a kind of humorous historical novel; the satirical Ursichtig von Meckelsburg (1874), and others. Reuter lived at Eisenach in Thuringia, at the foot of the Wartburg, from 1863 till his death on 12 July 1874.

His Sämtliche Werke were published in 13 vols. at Wismar in 1873–83; to these Adolf Wilbrand added two more in 1875, together with a biography. The 7 volumes of a popular edition (1877–78) have each gone through several editions. Other biographies of him have been written by Glagen (21 ed. 1875) and Ebert (1874). See also Gaedert, Fritz-Reuter-Relebungen (1885) and Reuter Studien (1890), and consult McCallum's Studies in Low German Literature (1884).

Reuter. HABON PAUL JULIUS, well known from the familiar newspaper heading 'Reuter's Telegram,' was born at Cossel, 21st July 1821. In 1841 he learned the printing trade, in 1843 he formed in Paris a partnership for collecting (partly by pigeon post) and transmitting by telegraph commercial and financial news; and in 1851 he transferred his headquarters to London. As telegraphs extended throughout the world he multiplied the ramifications of his system till it embraced the remotest regions. He never induced his partners but an earnest and persevering man, Reuter did not reach—e.g. between Pekin and Kinhia. In 1865 Reuter converted his business into a limited liability company, and in 1871 he was made a baron of Germany. In 1872 the Shah of Persia gave him the sole right of making railways, working mines, in so far as they witness to us the most remarkable events, which were tried and annulled in 1890, when the concession of the Imperial Bank of Persia was conferred on him. He died 221 February 1869.

Reutlingen, a town of Württemberg, 8 miles E. by S. of Tubingen and 20 S. of Stuttgart. Many of its houses are old and picturesque. The church of St Mary (1247–1343), with a tower 243 feet high, is a noble Gothic edifice. Woollen and cotton yarns are spun, and cloth, leather, cutlery, hosery, paper, &c. are manufactured. Reutlingen was formerly a free imperial town and a member of the Swabian League; it came to Württemberg in 1802.

Pop. (1890) 18,542.

Reval, or Revel, a Russian seaport, capital of Estonia, stands on a small bay on the south side of the Gulf of Finland, opposite Helsinki (52 miles distant), and 282 miles by rail WSW. of St Petersburg. It is divided into the (old) upper and (new) lower towns. The former is the cathedral, the castle, governor's residence, and the houses of the (German) nobility. The new town extends outside the city walls. There are several medieval guild-houses, in some of which are preserved valuable archives, and an important museum of antiquities. Revel exports cereals (chiefly oats), spirits, flax, and other commodities to the value of more than 23 millions sterling; and imports cotton, coal, and other goods to the value of 62 millions. There is little industry, brandy, vinegar, and wool being manufactured to a small extent. Pop. (1897) 64,578, of whom more than one-half were Estonians, and nearly one-fourth of German descent. Reval was founded by Waldemar II. of Denmark in 1219, and became a flourishing Hanse town. It was long held (from 1346) by the Livonian Knights, was made over to Sweden in 1561, and was besieged by Peder the Great of the Russian empire in 1710. In 1713 a naval harbour was founded. See works by Bunge (1874), Aumühl (1884), and Hansen (3d ed. 1885).

Revalenta Arabica. See Lentil.

Revellé (the true French form being reefé), the morning call for troops. See Bugle.

Revelation is a familiar theological expression, commonly applied to the knowledge of Himself which God has given to man in Holy Scripture. In itself, however, the word is properly used not merely of the divine knowledge communicated to us in Scripture, but of all divine knowledge communicated through whatever source. Conscience and reason are in themselves means of revelation. In so far as we are witness to the divine laws which bind our moral life, and in harmony with which the health and happiness of that life can alone be found. History is also a species of revelation, unfolding, as it does, the same divine laws collectively in the race. Then nature reveals to us the divine wisdom, goodness, and beauty; and science, the interpreter of nature, in so far as it makes known the great laws governing the material universe, truly makes known the divine will to us. But it is with the Scriptures of the Old and New Testament that the idea of revelation is all but necessarily identified. The Holy Scriptures are by all Christians regarded as in a special sense the medium of divine revelation to the human race; God having therein made known more fully and
clearly than elsewhere His will and character. But at the same time we must not confound revelation, in its fact and essence, with the books of Scripture. These books are only the highest or most distinguished form or medium of revelation, which, in its true sense, implicates simply communication from one mind to another, and, in a religious sense, from the divine to the human mind. Scripture is, in its several books, regarded as the pre-eminent medium of this contact or interchange of the divine and human, as the record of special communications from God to His ancient and holy men, who spake as they were moved by the Holy Spirit. It contains, in short, a revelation for us; but the revelation is not the record, but the knowledge which the record conveys to our minds. See Bible, Inspiration.

Revelation, Book of, the last book of the New Testament canon. Tradition.—In the oldest extant MSS. the title is simply 'Apocalypse' [i.e. Revelation] of John ('Apokalypsis Ioannis'), and thus does not go beyond what the book itself declares. The further designation of the author in the textus receptus (fully accepted Version) as John 'the divine' has no good MS. authority, but is an echo of the undoubtedly early tradition which identifies him with the author of the fourth gospel (who was called theologos, translator, of the divine, first by Euselius, because he begins his gospel with the earthly anology of Jesus but with the doctrine of the divinity of the Logos), and of the tradition which identifies the author of both works with John, the son of Zebedee, one of the twelve apostles. Other comparatively ancient names for the title ('Chiliastic', 'mythical') in time past to be rejected in this sense, are 'The Revelation of John the Divine and Evangelist,' and 'The Revelation of the Apostle and Evangelist John.'

The 'Apocalypse of John' is included in the Muratorian canon; it was also reckoned by Origen among the 'homoioiopana' or 'acknowledged' books of New Testament Scripture. It was held in high esteem by Irenaeus, Hippolytus, Clement of Alexandria, and Tertullian. Justin Martyr (circa 147) makes reference to it as the work of the apostle John, and it was used by Theophilus of Antioch (circa 180) and Clement of Alexandria and commented on by Melito of Sardis (circa 170). Outside the Catholic Church it was accepted by the Montanists. On the other hand, it was rejected by those whose Ephesians calls Abiell and by the Marchen, while the so-called Revelation of Barlaam and Josaphat were rejected by an ecclesiastical named Gaius or Caius; his arguments in turn were controverted in an apologistic writing by his contemporary, Hippolytus. It is mentioned as one of the 'antilegomena' or 'disputed' works by Euselius; it is absent from the Syriac, and from the MENA and Thebaie (Egyptian) versions of the Scripture, and from the lists of Cyril of Jerusalem, Gregory Nazianzen, and Chrysostom, as well as from the canon of the Council of Laodicea, and from the so-called 'Clementine' (circa 150). There is no trustworthy evidence that Papies knew it.

As regards authorship, the book itself claims to be written by 'John, the servant of Jesus Christ,' 'who bare witness of all things that he saw;' and it is to be observed that many of the incidental references to events which were very recent, and repetitions of this statement. But the reception of the Apocalypse into the canon was no doubt partly determined by the belief that this John was the son of Zebedee. This belief is implied in the Muratorian canon, and the reference of the apostle is carried forward by Justin Martyr and Irenaeus. Dionysius of Alexandria (circa 250), however, while not disputing the canonicity of the book, found himself unable to overcome the arguments of certain who had preceded him against its apostolic authorship, and he accordingly assigned it to 'some other' John—perhaps (he thought) John the Presbyter. Ensenius with some definiteness assigned it to the last named.

As to the date of its composition, its tradition is far from consistent. The author of the Muratorian fragment, for example, incidentally places it earlier than the Pauline epistles; but Irenaeus expressly states that it 'was seen towards the close of the reign of Domitian.' This statement of Irenaeus is in harmony with the passage just quoted (4, iii. 2) where it is said that the book was also written then; but more probably he intended his readers to understand that it was written after Domitian's death—under Nerva, or perhaps even in the reign of Trajan, to which period, according to Irenaeus, the apostle survived. But Tertullian seems to suggest the time of Nero as the date. Jerome dates the supposed banishment of John certainly, and the writing probably, in the 14th year of Domitian; but in this, perhaps, he is only repeating Irenaeus. There is some reason to think that this date is partly derived from an interpretation of the book as a whole, which was undertaken by any ancient writer. Attention was for the most part confined to two or three isolated points. It need hardly be said that, as regarded the millennium, the ancient church was entirely of the 'futurist' school, and that in those quarters where the Apocalypse was most prized as an authentic vision of the future—the interpretation always tended to be literalist and 'chiliastic.' As for another conspicuous feature—the beast and the number of the beast (see Apocalypse Number)—it is surprising how early the key to this enigma seems to have been lost. Irenaeus confesses ignorance, and even rejects the interpretation professedly given by the church and delivered from tradition.

The discussions of the Apocalypse by Melito and others have not been preserved; but from the earliest extant commentary—that of Victorinus (circa 300)—it may be inferred that no systematic attempt at a consistent interpretation of the work as a whole was undertaken by any ancient writer. Attention was for the most part confined to two or three isolated points. It need hardly be said that, as regarded the millennium, the ancient church was entirely of the 'futurist' school, and that in those quarters where the Apocalypse was most prized as an authentic vision of the future—the interpretation always tended to be literalist and 'chiliastic.' As for another conspicuous feature—the beast and the number of the beast (see Apocalypse Number)—it is surprising how early the key to this enigma seems to have been lost. Irenaeus confesses ignorance, and even rejects the interpretation professedly given by the church and delivered from tradition.

Victorinus, however, explained Rev. xii. 3 as having reference to Nero; and so also did Stilpius Severus. To Origen and the Alexandrians, with their allegorising methods of interpretation, the problems of the Apocalypse were of comparatively little interest. Later, after the time of Constantine, the 'beast' was identified with pagan Rome, or the seven heads of the beast with seven world-empires, and Augustine was one of the first to give currency to a form of 'preterism,' holding that the millennium began with the Christian era—a belief which again became active in the 11th century. With the lapse of time came almost inevitable modifications, both of the preterist and of the futurist view, alike among those who held that the threefold series of events (seals, trumpets, vials) in the book related to chronologically successive events, and to those who, with Augustine, viewed them as parallel (theory of 'recapitulation'). Medieval sects recognised the papacy in the woman on the scarlet beast, an interpretation which very rightly was not adopted by the Protestant domain, and still holds its ground in many quarters.

Modern Criticism.—The modern criticism of the Apocalypse may in a sense be said to have begun with Luther. The most famous passage of his New Testament (1522) declared that for many reasons he was unable to accept this book as either apostolic or prophetic. 'My spirit cannot adapt itself to the book.' The chief reason he alleged
were the little prominence it gave to Christ, and the peculiar manner of its teaching, so unlike the rest of the apostolic teaching or that of Christ himself. In 1530 he somewhat modified the language he had used, but he never withdrew his unfavourable judgment of the Apocalypse. From then till almost the close of the 16th and 17th centuries (Carlstadt, Flacius, and others) was that the Apocalypse can claim at best only the third and lowest degree of canonical authority. Zwitigl in 1528 refused to regard it as Scripture or to admit the validity of the problems it raised. The Apologists from Justin onwards abstained from commenting on it. Its 'deutero-canonical' character, however, was never made prominent in Britain, and was gradually lost sight of even in Germany. Mention may perhaps be made of the English work of Abauzit on the Revelation (1730), which called forth some controversy at the time of its appearance; but, strictly speaking, the discussion of the critical problems of the book did not enter upon its modern phase until the time of Semler, 'the father of modern biblical criticism,' who in 1769 and following years, from a comparison of the Apocalypse with the New Testament, arrived at the conclusion that an apostolic authorship could not possibly be claimed for both, and, starting from this canon, denied it to the latter. The same view was taken up by Schleiermacher and his immediate disciples, the most brilliant of whom—De Wette—ultimately gave up this 'disjunctive canon' as one of the most firmly established conclusions of modern criticism (1826); so also Ewald (1828). To obviate the force of some at least of Semler's arguments, those who wished to maintain the apostolic origin of both works found it important to make out an earlier date for the Apocalypse than was currently accepted tradition, following Irenæus, had assigned to it. In their efforts to do so they were powerfully supported from 1845 onwards by the Tubingen school, which had also accepted the 'disjunctive canon,' though choosing the opposite alternative to that adopted by Schleiermacher, and maintaining the apostolic character of the Apocalypse, ranking it indeed as one of the five undoubtedly genuine remains of the apostolic age (Haur, followed by Schwengler, Zeller, S. Davidson, &c.). Various opponents of the Tubingen school followed Semler and claimed the non-apostolic character of the Apocalypse at least. Thus, Lücke and Neander attributed it to some unknown John; Ewald, Bleek, Dübner, and the presbytery of the Apocalypse. Hitzig to John Mark. Meanwhile all sections of the historical school of exegesis were at one in the effort to see and if possible understand the book in the light of the actual circumstances of its writer. Among the details that came into greater clearness were the historical references in the beginning of chapter vii, the indication of date supplied by xi. 1, 2, and a very probable explanation of the Celcius (so called) which was first given by Fritzsch in 1831 and afterwards rediscovered, independently it is said, by Renøy, Hitzig, and Reuss in 1837. Much of the evidence pointing to an early date for the book was, as already indicated, specially welcome to those who still maintained the apostolic authorship alike of the Gospel and of the Revelation, for it was becoming increasingly plain that the differences of language and conception between the two works were peculiarly inexplicable if both were assumed to belong practically to the same period in the life of the Church.

On the other hand it was felt to be difficult wholly to set aside the traditions which pointed to a later date, especially as these best explained some of the doctrinal peculiarities of the book, and many of the phenomena presented by the condition of the 'seven churches' to whom the book is primarily addressed. The two-sided character of the evidence, both external and internal, as to date is indeed obvious when one looks at it with any care; and as early as the middle of the 17th century it had occurred to Grotius (1644) that the problem raised by its authorship was of such a nature, that the assumption that the book was written by its one author at different times, partly in Patmos and partly at Ephesus. Vogel in the beginning of the 19th century (1811-16) offered a different solution—that it was written partly by the apostle John and partly by the author of the Apocalypse, a theory that was found to have had some attraction for Schleiermacher, and, temporarily at least, for Bleek. The theory of a composite origin of the work has in a variety of forms come into very great prominence quite recently. Thus, according to the acute analysis of Volter in his singularly able and instructive work On the Origin of the Apocalypse (1882; new ed. 1885; compare the appendix to Simcox's Commentary), the original Apocalypse as written by the apostle in 65-66 A.D. consists of i. 6-iv. 1-7; iv. 1-10; vii. 8-14; viii. 1-ix. 21; xiv. 1-22; xv. 1-16; xvi. 17-xx. 11-16, xx. 17-xxii. 21. For this the apostle himself three years later (68-69 A.D.) added x. 1-xi. 13; xiv. 8; xvii. It received subsequent additions by other hands in the time of Trajan (xii, 16-22; xlii. xvi. 11, 12; xx.; xxi. 1-8), of Hadrian (v. 11-14; vii. 9-17; xlii.; xiv. 4, 6, 9-12; xv. 10-13-17, 19, 20) and two later A.D. and probably also from the Apostle Paul. From Pompey's capture of Jerusalem in 63 B.C. (x. 10, 2a, 8-11; xi. 1-13; xiv. 14-20; xvii. 3-4, 6, 8; xvi. 1-12, 17, 21; xvi. 1-6; xvii. 1-19; xx. 1, 2, 3a, 15) and from Caligula's time about 40 A.D. (vii., viii. 1-5; viii. 2-13 xix.; x. 16, 29-7; xi. 16, 19; xii. 1-14; xiii.; xiv. 13-16, 17-20; xix. 12-21; xx. 1-15; xxi. 1, 5, 6.) These three sections of the work correspond roughly, it will be seen, to the visions of the seals, the trumpets, and the vials. The work of reduction, Spitta holds, was completed of the 1st century. He finds the original number of the beast (616) in the name of Caligula (Gaius Caesar), and considers that it was only afterwards adapted to that of Nero (606). The treatises on the Revelation by Erbes (1891) and Schmids (1891) are in tendency similar, and treat the subject they deal with is still under active discussion: but it is already felt by all competent judges that the investigation thus inaugurated is likely to lead to valuable results, and ultimately perhaps may be found to afford an approximate solution of the problems connected with the Apocalypse, and so make it,
instead of being the obscurest, one of the clearest dogma is relative to the development of thought and feeling in primitive Christian times.

Literature.—For the text of the Apocalypse, which is more unsettled than that of any other New Testament book (the five uncial MSS. present the unusually large proportion of readings which are virtually unanimous), see 400 "The Apocalypses of the Dead Sea", 1879, by B. Weiss (ed. with critical notes [Leip. 1891], ought to be consulted. On the modern critical questions, besides the recent works of Völter, Spitta, and others already named, there are those of Reuss (1st ed. 1887), Weiss (2d ed. 1889; Eng. trans.), and Holtzmahn (Eng. 2d ed. 1886; also special introduction to his Handbook on Revelation, 1891). Of late works see also G. Rammel’s Apocalyptic Loci, 1862; English trans. 1878. Much useful information is given in G. D. Salmon’s Introduction to the Johannean Writings (1891); also in Farrar’s Early Days of Christianity (1892); Renan’s L’Antichrist (1873; Eng. trans.), and Chantrell’s L’Apocalypse et son Interprétation historique (1888). Of commentaries the most important or useful are those of Ewald (Lat., 1829), Lücke (1832), Weiss (Eng., 1846), Ewald (German, 1862; Eng. trans.), Renan (1868; Eng. trans. 1878), and Spitta (1889); this work being specially useful for the account it takes of the mass of current apocalyptic material which presumably was at the disposal of authors and early interpreters. The unfulfilled and unfulfilled prophecies of the Apocalypse have been very great; most of them until very recently wrote on the assumption that every one of these either has received or is to receive a full and complete fulfillment, though exact, and they can be classified according to their views of the manner of this realization. Those, for example, who, following the indication of Augustine, think that the denominations already come or even is already past, may fairly be called preterists. Of those to which mention is made, who identified Gog and Magog with the Turks in Europe, and Hengstenberg, who judged the man and beast already decided in 1837; on the other hand, who think that the kingdom, in any definite sense that can have been intended by the author, is yet to come, may equally just as be called "futurists," but they are of various degrees, some holding that none of the special preliminary events which are described as leading up to the millennium have as yet taken place; while others, sometimes referred to as the "elaborative," or, as they are designated in Spitta, have been characterized by the editor in these words, as "perhaps the most brilliant example," read into the book (with very wide divergences as to detail) what they consider to be the leading incidents in the political or ecclesiastical history of Europe in the last century; of the first description are most of the so-called "millennialist" writers; to the second belong the followers of Mede (1827). Apart from these definite schools, there is a mixed class of writers who are spiritualizing or idealizing or who were represented in ancient times by the Alexandrians, and whose method has often been found in modern times a convenient refuge for exegetical timidity or helplessness. Recent commentators with any character for sobriety to lose have, as a rule, been exceedingly cautious in dealing with the predictive element in the Apocalypse, some maintaining that its prophecies admit of a variety of fulfillments, but without attempting concrete interpretations of the past and still less definite forecasts of the future, by their light; while others go so far as to deny that the "peculiar element in the book," as it has been called, was from the very first intended to be read as a more or less imaginary picture of the kind of vicissitudes through which the church militant has passed and may be expected to pass before it reaches its final triumph. See Düsterdieck (in Meyer’s Commentary, 1859; new ed. 1887), Lee (in Speaker’s Commentary, 1881), Boyd Carpenter (in New Testament Commentary for English Readers, 2d ed. 1891), and in Expositor’s Bible, 1889), and Simcox (in Cambridge Bible for Schools and Colleges, 1880).

Revell, MASTER OF THE, the name of an officer, also called "Lord of Misrule," formerly attached to royal and other distinguished houses. It was his function to preside over the amusements of the court, or of the nobleman to whose house he was attached, during the Christmas holidays. The universities of Oxford and Cambridge and the Inns of Court had also their Lord Misrule. This officer became a permanent appendage to the English court in the reign of Henry VIII., and his duties included the keeping of the tents and pavilions which accompanied the sovereign on a royal progress, as also the keeping of the dresses and masks used in entertainments in the court, and the providing of new ones when required. In Queen Elizabeth's time the Mastership of the Revels was divided into several distinct offices. The office practically fell into desuetude about the end of the 17th century. See Poos (Feast of); and Wotton (Christmas). 

Revenue. The public revenue of the civilised states of the world is in every case treated of in the articles on the several countries in the section dealing with finance; thus, the various elements of the British revenue at different periods, as compared with the expenditure, is somewhat fully given at GREAT BRITAIN, Part. II. of the volume, p. 376. The inland revenue is distinguished from the Customs Duties (q. v.), and includes (1) the Excise (q. v.), comprising alcohol duty, liquor and luxury licenses; (2) Stamps, with the "death duties," probate, account, legacy, and succession duty; (3) Taxes on property, as real estate and personal property tax, land tax, and succession duty (see TAXES). The right of the Commons to regulate taxation and the onus of the national income is treated at PARLIAMENT, Vol. VII. p. 774. Below is a comparative table of the gross revenue of the principal civilised states for the years 1888 and 1890:

The revenue of Canada is £7,970,000; Cape Colony, £4,340,000; New South Wales, £3,063,397; Victoria, £2,676,081; British India, £561,000. In 1890–96 the revenue of Great Britain exceeded £100,000,000; in 1893–96 it was £105,614,000, besides £28,000,000 from local taxation; and with that of all the dependencies was well over £200,000,000.

For Revenue Officers, see COASTGUARD.

Reverberatory Furnace, a furnace so constructed that ores and other materials may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts—vizz. a fireplace at one end; in the middle a flat bed to be heated is placed; and at the other end a chimney to create a draught and to carry off the smoke or fume. Between the fireplace and the bed a fire-bridge is placed, and the whole built over with a flat arch, dipping towards the chimney. The flame plays over the fire-bridge, and the heat is reflected, or reverberated, on the material beneath; hence the name. See COPPER, LEAD, and IRON (furnace building).
was stopped, but a companion succeeded in reaching Concord. During the war he rose to lieutenant-colonel; and after his return due to the goldsmith's work, and in 1801 founded the Revere Copper Company at Canton, Massachusetts. He died 10th May 1818. His ride is the subject of a well-known poem by Longfellow.

Reverend (Lat. reverendus, to be respected), a title of respect given to the clergy. In the Anglican Church deans are 'Very Reverend,' bishops, 'Right Reverend'; and archbishops, 'Most Reverend.' In Scotland, the clergy in general are 'Reverend,' while it is the practice to apply 'Very Reverend' to the moderator of the General Assembly for the time being, and to the principal of a university, being a clergyman. The style Reverend is generally adopted by and given to the clergy of the different dissenting bodies; and in 1876 the Privy-council decided on appeal that there is no law restricting it to ministers of the Church of England. There have, however, been instances in which some dissenting ministers have repudiated it. See ADDRESS (FORMS OF).

Reversion is the right to the enjoyment of money, or of any kind of property, postponed until or contingent on the happening of a given event. Reversions are usually divided into three classes: Absolute Reversion, in which the emergence of the rights is certain, Contingent Reversion, and Reversionary Life Interests. In the first case, when the reversionary interest is a fixed one, the value of the reversion is dependent merely upon the operations of interest (see INTEREST). When the date of the emergence of the reversionary right is uncertain, the purchase in an individual case must always be a speculation; but if there are a sufficient number of such rights, postponed to events of which there are sufficient observations from which to deduce laws of average, then the marketable value is easily calculated. For example, it is requisite to know what is the immediate value of £100 payable certainly on the death of a man aged sixty. Here the value of the reversion is £100, under deduction of the prior life interest, which in this case is the present value of annuity equal to the interest of £100 on the life of a man aged sixty. When an assurance company buys a reversion, it is simply buying that which it sells when it grants the right of life interest to its former case, however, an office, to secure its expenses and profits, will assume a high rate of interest and a long life; in the latter case, for the same reason, it will assume a low rate and a short life. By the Sale of Reversions Act, 1867, no purchase of a reversion is challengeable on the ground of undervalue merely. Where the reversion is contingent, problems arise whose solution requires the utmost skill on the part of the actuary. For instance, if, aged thirty, wishes to borrow £100 on the security of a sum payable to him in the event of his surviving his father until the latter shall be sixty, the security being doubtful, it could only be rendered marketable by assuring a sum to be paid in the event of B dying before A; and there would remain the important question of what this sum should be. It may cover the loan and the premiums of assurance with interest at 5%, but the value of the reversionary life interest is found by deducting the value of a joint life annuity from the value of the annuity on the life of the survivor (see the Institute of Actuaries' text-book, part ii.). Reversion is that right to property which remains after some particular term of years, which had been granted by the owner. Thus, if A has a lease estate in B's property, and after he dies the property returns to H, H is said to have the reversion or to be the reversioner. The landlord of property let to a tenant is called the reversioner, because the tenant only holds the use: the owner, or reversioner, the interest in the property and possessions vested in him. In Scots law reversion means the right of redemption retained by a borrower over an estate disposed in security.

Reversion, a term used to describe the tendency of animals and plants to show characteristics of some persistent past form. This is most prominently transverse bars on the legs and shoulders, and a blue pigeon like the wild rock-dove (Columba livia) sometimes appears even in a perfectly pure breed. See ATAVISM, and DEGENERATION.

Review. See PERIODICALS.

Revilina-Gigedo, a rocky and uninhabited island group in the Pacific, 400 miles west of the coast of Mexico, to which it belongs. The largest of the islets is 20 miles long.

Rivéville, Albert, a French Protestant theologian, was born at Dieppe, November 4, 1826, studied at Geneva and Strasbourg, and was pastor of the Walloon Church at Rotterdam in 1851–72. Then he lived near Dieppe until his call in 1880 to the chair of the History of Religions in the College of France.

His numerous books include Manuel d'Histoire comparée de la chrétienté et de la tradition juive (Scholten, 1859; Eng. trans. 1861); De la Redemption (1860); Essai de Critique Religieuse (1860); Manuel d'Instruction Religieuse (1863); Histoire du Pape de la Divinité de Jesus Christ (1869; Eng. trans. 1870); Protogénèses de L'Histoire des Religions (1881; Eng. trans. 1884); The Native Religions of Mexico and Peru (the Hibbert Lectures for 1884); Les Religions des Peuples Non-civilisés (1889); and La Religion Chinoise (1889).

Revising Barrister. See BARRISTER.

Revival, or REVIVAL OF RELIGION, a term employed to denote an increase of faith and piety in individual Christians, particularly after a period of religious declension, and also an increase of religion in a community or neighbourhood, both through the revival of those who are already religious, and through the conversion of the previously irreligious. Such religious movements frequently extend, more or less generally, over a neighbourhood, or sometimes over a country. Instances of a similar kind are recorded in the Scriptures as occurring both in the history of the Old Testament and in the early history of the Christian church, particularly in the effusion of the Holy Spirit on the day of Pentecost, and afterwards in connection with the ministry of the apostles, when many were converted through a single discourse, or, in other cases, evidently within a short time. In the middle ages revivals took place in connection with the Crusades and under the auspices of the monastic orders (see CHURCH HISTORY); and sometimes with repulsive adjuncts, as in the case of the Flagellants (q.v.) and the Dancing Mania (q.v.). The Reformation of the 16th century, and the more partial movements of the 17th and 18th centuries, were also regarded as essentially revivals of religion—the Reformation itself the greatest which has taken place since the apostolic age. In Scotland there were notable "works" in 1625 at Irvine and Stew- arton, in 1630 at Kirk-of-Shotts, and in 1638 at the Hebrides. The whole movement of the kind was that in the first half of the 18th century from which the Methodist churches originated. It was accompanied with many circumstances similar to those which have attended later revivals of religion. The movement began to be commonly employed till after this period; and the revival which took place in New England and other parts of North America about the same time under Edwards, Bellamy, and the
Tentsmen was generally designated the Great Awakening. The beginning of this revival seems to have had no connection with the Methodist movement in England, although subsequently they became connected through Whitefield's visits to North America. There were revivals at Cambridge in 1742 and among the Quakers in 1728.

A very extensive revival in Wales resulted in the formation of the Welsh Calvinistic Methodist Church, but was not confined in its effects to those who became connected with that church. Local revivals also in some instances attended the ministrations of Evangelists, and in the latter part of the 18th century in America. There were revivals in 1796, in 1812-15, and again in 1827-32. In 1839 the attention of all Scotland was drawn to a religious movement at Kilsyth, originating in the preaching of Mr. Porter, that was not generally attended with scenes of great excitement; strong but calm religious feeling was its general characteristic. It spread all over the United States, and it was believed that in a single year half a million converts were received into the religion professed. The revival extended to Ireland, and rapidly extended over the whole north, and subsequently to Scotland, Wales, and some parts of England. As a rule it was free from excitement, and characterised by little else than the intensity of religious feeling displayed.

Another remarkable revival, which extended over the greater part of Great Britain in 1874-75, originated in the efforts of two American evangelists, Messrs Moody and Sankey, and was characterised by the almost entire absence of sensationalism. The Salvation Army carries on its work largely by methods known as revivals. Revivals of religion have occurred also in other parts of the world. Though evangelical Christians generally recognise revivals as in the main divine works of grace, they agree in deploiring the extravagances and the sensationalism that have not unfrequently accompanied them and done grievous harm to the cause of religion.

See Fleming's "Fulfilment of the Scripture" (1861); Edwards, "The Work of God in New-England and New-Britain" (1746); Bobe's Narrative (1742); Pringle, "Surprising Accounts of the Revivals of Religion in the United States" (1802); lectures on the subject by Sprague (1833) and Finney (1833); Mrs Landis' "History of Revivals of Religion in the British Isles" (1840); Linley, "Handbook of Revivals" (1874); Porter, "Revivals of Religion" (1877); Overton's "Evangelical Revival of the 19th Century" (1886); and the journals and biographies of the Wesley's, Whitefield, the Haldanes, and other eminent evangelists.

**Revival of Learning.** See Renaissance.

**Revolution**, any extensive change in the constitution of a country, suddenly brought about. The most important events in modern history specifically known under this name are the English revolution of 1649 (Guzin by 'Revolution' means the 'Great Rebellion'); the American revolution of 1776; the French revolution of 1789; the English revolution of 1688; the French revolution of 1789; the American revolution of 1812, which terminated in a peace unoffensive and unprofitable; the French revolution of 1830, which deposited Charles X. and raised Louis-Philippe to power; the revolution of 1848 ('the revolution of February'), which established the second republic; and the revolutions by which the existing South American republics (forty out of fifty in 1809, and of Chili in 1819) were established or were from time to time modified. The revolutionary period per excellence is the years 1848 and 1849. The French change of constitution in 1871 is not usually spoken of as a revolution, though in effect it was one. For the Revolutionary Tribunal, see Danton.

**Revolver**, in Firearms, is a weapon having barrels or chambers which revolve upon a common centre, and are fired in turn by one lock mechanism. Revolving firearms date from the century into line; with the revolver Lock-Hammers, having two or more barrels were mounted to turn upon an axis, and so arranged that the powder-pans came successively under the action of the lock; the barrels were not rotated by pulling the trigger, but were turned by the hand. The celebrated Marquess of Granby received several such. In 1815 Le Norman, a Parisian gunsmith, produced a pistol with five barrels, Devisme one with seven, but neither proved successful. The 'Mariette,' made with from four to twenty-four barrels, was the first to become popular, although from its weight, cumbersome mechanism, and short range, it could have been of little use except at close quarters. This pistol was the precursor of the 'pepper-box' pistol, to which it was closely allied; the barrels of both were bored in a solid mass of metal, and made to revolve as the hammer was raised to full cock. Not so old as the principle of revolving barrels, but still an invention of past generations, is that of a revolving chamber or breech-piece, pierced with cylindrical apertures to contain the charges, and so arranged that each chamber came successively into line with the barrel and lock common to all. E. H. Collier in 1818 patented an improved carbine with three revolving chambers, which appears to have been an efficient weapon. Colonel Samuel Colt produced his world-renowned revolver in 1835. This consists of a rifled barrel, a revolving cylinder with six or seven chambers, each furnished with its own nipple and cap, and a lever trigger, which operates the mechanism required to turn the chambers and fire the weapon. The double-action revolver, is one in which by simply pulling the trigger the hammer is raised and released, and the chambers turned; whilst in the single-action revolver the hammer is raised by the thumb of the firer and released by the trigger.

Breech-loading revolvers are of two kinds — the solid frame revolver, which requires the empty cases to be forced out by a diminutive ramrod (generally attached to the pistol by a swivel), and the self-extracting revolver, of which there are many kinds. The regulation pistol of the British army is that illustrated here. By pressing the lever, e, the bolt securing the top of the hinged frame is released, and the barrel turning upon the hinge raises the chambers, whilst the extractor-rod coming into contact with a spur-lever, flips out the fired cases and returns into position; the chambers are thus exposed for loading, and upon the barrel being raised the breech-bolts snap home.
and the pistol is ready for firing by pulling the trigger. This principle is the most popular of any employed for self-extracting revolvers, and it has proved efficient. There are many types of revolvers, self-extracting and other, but, with the exception of cheap weapons and some single-action solid-frame revolvers popular in America, the principle adopted by many other models they now make one in which the hammer is covered, and the pistol can only be fired when firmly grasped by the hand, as a safety belt, which effectively and automatically bolts the firing mechanism, projects through the haft, and has to be pressed in before the trigger can be drawn back to raise the hammer and fire the weapon. This pistol is perfectly safe, and insures immunity from such accidents as arise from careless handling.

For military purposes the revolver is generally made of half-inch calibre, and such a weapon has a range of from 100 to 300 yards, whilst at 50 yards ten consecutive shots have been placed in a 4-inch bull's-eye. At shorter ranges its precision is equal, and to that of the finest duelling pistol. Revolving arms of large size are used as Cannon (q.v.) and Machine Guns (q.v.); and for further particulars of revolving arms see Fusil and Revolver (Boston, 1889); and British service publications.

**Revue des Deux Mondes**, the best known of the French magazines devoted to literature, art, and general criticism, was founded in Paris in 1831, by Francois Bulot. It had appeared during 1829, but was languishing until purchased by Bulot, who firmly established it. Many of the best French writers have contributed to its pages.

**Rewa**, a state of India, called also Baghel-khand (q.v.).—*Rewa Kantiha* is the name of a political agency under the government of Bombay, containing sixty-one small states, of which five are tributary to the British government, and most of the remainder to Baroda. The territory included, covering 4,792 square miles, with total population 5,434,452, lies mainly along the south bank of the lower Nerbudda with patches north of it, and on the west borders on Baroda, Baroda, and Ahmedabad.

**Reward**, in a legal sense, means some encouragement which the law holds out for exertions in bringing certain classes of criminals to justice. By statute 7 Geo. IV, chap. 64, the courts of assize may order the sheriff of the county, in which certain offences have been committed, to pay to persons who have been active in securing the apprehension of offenders charged with murder, or with feloniously shooting, cutting, stabbing, wounding, or wounding and inflicting grievous bodily harm, or with being accessory before the fact to any of such offences, or to receiving any stolen property, a reasonable sum to compensate them for expense, exertion, and loss of time. So by a later statute (14 and 15 Viet, chap. 55) courts of quarter sessions are authorised, in the case of any of the above offences which they have jurisdiction to try, to order such compensation; but the payment to one person must not exceed £5. If any one is killed in endeavouring to apprehend a person charged with one of these offences, the court may order compensation to be made to the family. The amount to be paid in all such cases is subject to regulations which may be made from time to time by the Secretary of State. By statute (24 and 25 Viet, chap. 96) it is a felony, punishable by penal servitude to the extent of seven years, to corruptly take any reward for helping a person to property stolen or embezzled, unless all due diligence be brought to the offenders to trial has been used. In Britain an advertisement offering a reward for the return of stolen or lost property, using words purporting to make such questions will be tantamount to the person producing the property, renders the advertiser, printer, and publisher liable to forfeit £50. For several years the offering of rewards by the government has in England been discontinued on grounds of public policy. For example, during the series of murders in Whitechapel in 1888-90, the Home Office, though urgently requested to offer a reward for the discovery of the criminal, steadily refused to do so.

**Rewari**, a town of the district of Gurgaon, in the extreme south of the Punjab, 50 miles SW. of Delhi by rail, an important centre for trade between Punjab and Rajputana. Pop. 29,900.

**Reyband**, Marie Roch Louis, a clever French writer, was born at Marseilles, 15th August 1799, travelled in the Levant and India, and returned to Paris in 1829 to write for the Radical papers and edit the Histoire scientifique et militaire de l'Expédition Française en Egypte (10 vols. 1830-36), Dumont d'Urville's Voyage autour du Monde (1837); Voyages d'Orléansy aux Amériques (1836). His studies in social science bore fruit as Études sur les Réformateurs ou Socialistes modernes (2 vols. 1840-43; 7th ed. 1864), which gained him the Montyon prize (1841) and a place in the Academy of Moral Sciences (1850). His unusually original satire novel, D'Après Patouret à la recherche d'une Place sociale (1843), became widely popular, and was followed by the less successful Jérôme Patouret à la recherche de la meilleure des Républiques (1848). Reyband took an active part in politics, first voted with the Left, but after the July revolution with the Right, and was sent by the Assembly to Algeria to visit the agricultural colonies established there. His last thirty years were devoted to studies in economics. From 1890 a member of the Academy, he died at Paris 28th October 1879. Among his later works were Croquis et recueils de voyages (1854), La France modern (1855), L'Industrie en Europe (1856), and Études sur le Régime des Manufactures (1859).

**Reynard the Fox**, a well-known popular epic the characters of which are animals instead of men. It belongs to the series of Beast-fables (q.v.) which have delighted the popular imagination from early ages and in all lands, from the Middle Ages to the Bushmen's country in South Africa (see FABLE). The stories that relate the knaveries of Reynard the Fox seem to have originated for the most part in northern France and Flanders from the 16th century onwards, and have been composed in many languages, particularly in various forms in the 12th and following centuries. The authors or editors, so far as they are known, belonged chiefly to the ecclesiastical orders. The several versions differ not only in respect of language and of style, but also in the choice and arrangement of the episodes and incidents narrated. All turn upon the knaveries of Reynard the Fox, as practised by him in his quarrel with Isengrim the Wolf, who in all encounters generally comes off second best. The best versions, as the typical French, are L'Enlèvement d'Infant (in detail lower down), reach a high level of literary excellence. The episodes are woven together into a veritable epic; the versification is agreeable and easy; the characters are consistent and well-sustained; the contemporary manners, and the localities and circumstances, that make the background of
the story are true and realistic; and the story is told without any other obvious purpose beyond that of affording honest amusement. These features do not, however, characterise all the versions: some have been critically written in French, but there are loosely-connected strings of ill-told adventures, others drag out a long and weary length through innumerable indifferent verses, whilst in others still the characters are simply men disguised as animals. The earliest version (1284) in Latin, but it seems to have been soon supplanted by French in the 12th century, and in their new dress the stories attained a much wider popularity. Since the beginning of the 16th century nearly all the editions printed can be traced back to one of two sources, a Flemish or a Low German, both of which, however, are based upon French forms of the epic. The task of tracing the connections between the numerous versions that exist in the different tongues is one of great complexity and difficulty. It will suffice in this place to enumerate the more important, with mention of one or more trust-worthv recent editions. The best Latin version, Isengrimus (ed. by Meon as Reinardus Vulpes, Stuttgart, 1832; and by Voigt, Halle, 1884), which possesses considerable literary merit, was written in Flanders about 1146-48 by an unknown author. The first German translation in Reinhardissen's Reinhart Fuchs (Berlin, 1834) is not an older, but a later and abbreviated, form of the same poem. The best French versions that survive were edited by Meon (4 vols. Paris, 1825), with a supplement by Chatelain (1835) and by Martin (4 vols. Strassburg, 1882-88). They were written between the middle of the 13th and the middle of the 14th century, and run to enormous length, the separate cycles or groupings of the episodes being called 'branches.' Meon's work includes three cycles: (1) Roman du Reynard, (2) Roman du Lion, and (3) Roman du Loup. Of not unconsidered authors, Pierre de St Cloud, a priest of Laerocix in Brie, and a Norman priest Robert de Lison; (2) Le Conoumement de Renart, attributed to Marie de France; and (3) Renart le Noueud, by Jaques Marin Glicée de Lille, about 1290. The last two are transcriptions in upon certain of the monastic orders. There is a fourth cycle, a voluminous compilation or imitation by a priest of the neighbourhood of Troyes, made near the middle of the 14th century, and entitled Le Renart Contréfait (ed. Reinhardissen, 1858), in High German version, Reinhart Vaehs oder Fuchs (ed. Reisenerberger, Halle, 1886), more usually called Reineke Fuchs, was adapted by some one unknown, early in the 13th century, from a still older version, Isengrimes Not, itself a translation made from old French sources about 1180 by an Alsatian, Heinrich der Glichesae. The Flemish version which has been the basis of most of the translations, continuations, and editions that have been made since the invention of printing is entitled Reynart de Fos (ed. Martin, Paderborn, 1731), written by William de Matoc, William Uttenhove, or more probably an unknown William, is uncertain, and dates apparently from the middle of the 13th century. The source upon which it is built is the nineteenth 'branch' of the French version in vol. i. of Meon). The text that has been almost exclusively used in the later translations, &c., is that of a second edition, deviating in some respects from William's own, notably in the infusion of a didactic, satirical tendency; the author of this second edition has been called William, but it is more likely to have been Simon de Cola, a relative of William (see ed. Reinhardissen, 1858). This second edition, published at Gouda in 1479, that Caxton made his translation of The History of Reynard the Fox (1481; reprinted Edin. 1884). Upon this same edition was based the Low German version, Reineke de Vos (ed. PrieN, Halla, 1887), which has been more often translated perhaps than any other version. Who the Low German translator was is not known, in spite of the question having greatly exercised many specialists. The adulatory preface of Rotstok (1498), and next to it stands that of Brestock (1517). There are Danish (by A. H. Weigere, Lübeck, 1555), Swedish (Stockholm, 1621), and several other High and Low German translations. A more recent one was contained in Simrock's Deutsche Volksbücher (vol. i. 1845) and Marbach's Volksbücher (vols. xv.-xvii.).

The outline of the story, according to the Flemish Reinwart, is as follows: Noble the Lion, king of animals, was holding court one Easter-tide. All the animals, great and small, came and paid homage to him except Reynard the Fox. Several amongst them complained of the knaves of Reinart, the lowest being Isengrim the Wolf, Reynard's old comrade and enemy. He was followed to the house of the Fox, but Grin- bart the Badger spoke up for his uncle. Then came Chanticleer the Cock, bringing his dead daughter slain by Reynard. For this and his other misdeeds the Fox shall not be resolved, but is to appear before the Lion and be tried. In the meantime the Fox, who had been reprieved, received him with soft words, told him of some honey hidden in a split tree, and contrived to get Bruin caught fast in the cleft of the tree; there the peasants found him and nearly beat him to death, but at last he got away and went back to court. The Lion sentenced him to death, and sent him to be hanged on a gallows. The Cat, however, persuaded him to catch mice in a place where a noose hung, in which the Cat got caught; and he too was terribly beaten before he got away. At last Grinbart the Badger offered to undertake the office of messenger; and he persuaded Reynard to go with him. On the way the Fox makes a sort of private confession of his rascality and misdeeds to his relative the Badger, especially of the tricks he has played off upon the Wolf. The animals again came forward with their demands, and again the Wolf was condemned to death. As he was about to be hanged on the gallows, he begged leave to make a public confession of his evil deeds. In the course of his speech he dropped a hint that he knew where an immense treasure was hidden, and then, at the Lion's request, tells all about it. His father, old Reynard, and Isengrim the Wolf, and Bruin the Bear had conspired together to slay the Lion and make Bruin king in his stead; but his (Reynard) had stolen their treasure, with which they thought to hire soldiers, and had gone and hidden it. He would not tell them where he had it, and wished Bruin and the wicked Bear to be made king in his place. The Lion thereupon pardoned him, and caused Bruin and Isengrim to be seized and evilly entreated. But when he asked Reynard to go and show him where the treasure was, he refused to do so, saying he was under an oath to make a pilgrimage to Rome. The Lion then let him go; and Reynard, taking with him Cuaerten de Hare and Belin the Ram, set out on his pilgrimage. On the way he passed his own home, and induced Cuaerten to go into the house with him, and there killed him, that he might put his head in a satchel (made from the skin of the Bear) and give it to Belin, and bade him carry it back to the Lion, telling him it contained valuable letters. When the Lion saw Cuaerten's head he was exceeding wroth, and bade them let the Wolf
and the Bear go free out of prison; and he gave the Ram into their power, and decreed Reynard to be an outlaw.

To this the Low German version adds a continuation, partly a repetition of the same incidents under a different name, which is partly a local variation of the story, ending in a single combat between the Fox and the Wolf, in which the former by trickery beat his antagonist. Finally he returned to his own home, honoured with the favour and protection of the Lion.

For further details consult the Introduction to W. J. Thoms' edition of Caxton's Reynard (1845), Carlyle's "Carlyle's Miscellaneous Essays" (not quite accurate), and F. S. Ellis' "History of Reynard the Fox" (1894). See also L. S. Reynolds, "Reynard in the German" (1898).

**Reynolds, John Falton**, an American general, was born in Lancaster, Pennsylvania, 20th September 1830, graduated at West Point in 1841, and became commandant there in 1839. As brigadier-general he fought at Mechanicsville and Gaines's Mills, and was taken prisoner at Glendale, but escaped in August after the battle of Bull Run his own bravery induced his brigade to stand fast, and so prevented a complete rout. In November he was commissioned major-general, and in 1863 commanded a corps at Fredericksburg. He was killed at Gettysburg, while returning from the battle of the James River on 18th June 1863. The state erected a granite shaft on the spot where he fell, and his men a bronze heroic statue on the field; and in 1884 an equestrian statue was unveiled in Philadelphia.

**Reynolds, Sir Joshua, P.R.A.,** portrait and subject painter, was born at Plympton Zareh, Devon, on 16th July 1723, the year of Kneller's death. His father, a clergyman and master of Plympton grammar-school, intended him for the medical profession; but he developed a strong aptitude for painting, was continually studying the plates in Cate's "Book of Emblems," Dryden's "Plutarch," and the other volumes that came in his way, and at the age of eight had mastered the "Jesuit's Perspective," and applied its principles to drawings executed by himself. In October 1740, accordingly, he was sent to London to study art, and accordingly managed, although he was but a portrait-painter, of very moderate abilities, much employed at the time. In 1743 he returned to Devonshire, and some of the portraits of local worthies which he then produced still exist. In the following year he was again in London pursuing the same studies. In 1747, after the death of his father, he settled in Plympton Dock, now Devonport, where he learned much from a study of the works of William Gandy of Exeter. In 1749 he made the acquaintance of Commodore, afterwards Lord Keppel, who invited him to accompany him on a cruise in the Mediterranean; and, after painting many of the British officers in Minorca, he made his way to Rome, where he studied Raphael and Michael Angelo, and in the Vatican caught a chill which permanently affected his hearing, and necessitated his use of an ear-trumpet during the rest of his life. He also visited Bologna, Genoa, Florence, Parma, and Venice. Returning to England in October 1752, he soon afterwards established himself in a studio in St Martin's Lane, London, and attracted notice by his portraits of the second Duke of Devonshire and Caroline, Duchess of Brunswick. Before he was in excellent practice, and in the year 1755 he had no fewer than a hundred and twenty sitters, of whom he produced portraits in which the influence of the Italian masters, and especially of Correggio, is clearly visible; works in which he was certainly aided by such assistants as March, but which he impressed with his own character and individuality.

He soon removed to Great Newport Street; and finally, in 1769, he purchased a mansion on the west side of Leicester Square, to which he added a studio and reception-room.

He was popular at the height of his fame, and a valued member of many celebrated contemporaries. In 1764 he founded the famous literary club of which Dr Johnson, Garrick, Burke, Goldsmith, Boswell, and Sheridan were members; all of whom were portrayed by his brush. He was one of the earliest members of the Incorporated Society of Artists, and contributed to "The Portraits" in 1768, when, on the establishment of the Royal Academy, he was elected its first president; and in the following year he received the honour of knighthood from the king. In 1769 he delivered the first of his Discourses to the Royal Academy, fifteen of which have been published. They are full of valuable and well-considered instruction, and, along with his papers on art in the "Idler," his annotations to Dr Froude's "Art of Painting," and his Notes on the Art of the Low Countries (the result of a visit to the Low Countries in 1781), show a correct and cultivated literary style. He contributed his picture of Miss Morris as 'Hope nursing Love' to the first exhibition of the Royal Academy, along with his portraits of the Duchess of Manchester, Mrs Blake, Mrs Crewe, and Mrs Sowerby; and in 1786, "Count Ugolino and his Children in the Dungeon," usually regarded as his most successful effort in the direction of historical art. In 1784 he succeeded Allan Ramsay as painter to the king; in the same year he finished and exhibited his portrait of Mrs Siddons as the 'Tragic Muse,' in the possession of the Duke of Westminster, undoubtedly his greatest portrait, a work existing in several versions, of which one is in the Dulwich Gallery; and in 1787 he undertook three subjects for Boydell's Shakespeare Gallery, executing 'Puck,' 'The Witch Scene from Macbeth,' and 'The Death of Cardinal Beaufort.'

Hitherto he had devoted himself with little interruption to his art, having speedily recovered from a slight attack of paralysis from which he suffered in 1782; but in July 1789 his sight became extremely bad, and he endeavoured to make an effort; but he was still able to enjoy intercourse with his friends. The following year was embittered by an unfortunate dispute with the Academy regarding the appointment of a professor of Perspective, which led to his resignation of the presidency, and the resolution of his friends to have him re-elected; and on the 10th of December 1790 he delivered his last Discourse to the students. Gradually his strength sank—for, unknown to his physicians, he was suffering from a painful form of liver complaint—and he peacefully expired on the 29th February 1792.

It is in virtue of his portraits that Reynolds ranks as the head of the English school of art. In the dignity of their style, the power and expressiveness of their handling, the variety and appropriateness of their attitudes, in the beauty of their colouring and the delicacy of their flesh-painting, his portraits have never been surpassed. He was at home alike in portraying the strength of manhood and the grace of the gentle sex; and his pictures of children have an especial tenderness and beauty which have given a world-wide celebrity to "Kate the Strawberry Girl," and "Simplicity." His efforts in the higher departments of historical and imaginative art were less successful, and too often these can be regarded only as among the failures of a great artist. In his technical methods Reynolds was unfortunately most careless and uncertain. He was continually experimenting in new processes
and untied combinations of pigments, with the result that even in his own lifetime his works deteriorated, especially in their flesh-tints. Persons of RHAMPSINITUS which 1813 pigments, them—37), with related title R.a a them—Ramses, 'which but as

Rhabdomancy. See Divination, Divining Rod.

Rhadamantus, in Greek Mythology, the son of Zeus and Europa, and brother of Minos of Crete. He settled in Boeotia, where he married Alcmene. So great was his reputation during life for the exercise of justice that after death he was appointed a judge in the under-world, along with Minos and Aeacus.

Rhedia, an ancient Roman province embracing a large part of the Alpine tract between the basins of the Po and the Danube, now included in the Grisons and the Austrian Tyrol. Its inhabitants were brave and turbulent, and were only subdued by Drusus and Tiberius after a desperate resistance. The province was then formed, to which Vindelicia was soon added; but later Rhedia was subdivided into Rhedia Prima and Rhedia Secunda (Vindelicia). The only important town in Rhedia was Tridinium (Trident); the colony of Augusta Vindelicorum (Augsburg) was in its northern part.

For Rhetic Beds, see Triassic System.

Rhannaceae (Buckthorns), a natural order of exogenous plants, consisting of trees or shrubs; often spiny; with simple, generally alternate leaves, and stipules minute or wanting. This order contains about 250 known species, natives of temperate and tropical countries, and very generally distributed over the globe. The prevailing principle in the buckthorns is a bitter extractive which is acrid or astrigent, tonic and anti-fibrile. Some of them are used in dyeing (see Brenchley, French Berries), some in medicine (see Red Root), and the fruit of some is pleasant (see Jujube); whilst Hovenia dulcis, a native of China and Japan, is remarkable for the thickening of its flower-stalks after flowering, so as to form a succulent sweet red pulp, with a

flavour resembling that of a pear. The lotus of the ancient Lotusphagi, celebrated by Homer, is the fruit of Zizyphus lotus, a small shrub abundant in Spain, Sicily, Barbary, Tunis, and parts of the African coast.

The wood of Rhoeo ensiformis yields a superior charcoal for the manufacture of gunpowder.

Rhampsinitus, a Grecised form of the Egyptian name Ramses, apparently Ramses III., the builder of the pavilion of Medinet Abu at Thebes. Bruges makes Rhampsinitus a Greek form of Ramessiacum, a title given by Ramses III. to Ramesses-ai-nil (‘Ramses, son of Neith’), a title never borne by the Theban kings, but first used by the Saite princes, which fixes the date of the tale to the period of Psammethichus and his dynasty. Of him Herodotus (II., 121 et seq.) relates a story substantially the same as one of the most widespread folk-tales of the Aryan world. The king acquired an enormous treasure, and to secure it built a treasury of stone. The architect left one stone loose, so nicely adjusted as to be unnoticed, yet enabling it to remain in place without difficulty. Before death he entrusts the secret to his two sons, who from time to time plunder the king’s treasure at their will, until at length the elder is caught in a snare set by the king. According to his desire, the younger brother cuts off and carries away the stone, so that the treasury is known. The king now orders the heedless body to be exposed unburied, protected by a guard of soldiers, but the younger brother lades an ass with skins of wine, allows some of it to run out, and is relieved in his distress by the soldiers, to whom in gratitude he gives his ass. So freely that they all sink into a drunken sleep. Thereupon he shaves the right half of all their beards, and carries his brother’s body to his mother. The king next sends his daughter to find out the clever thief. She promises her love to the one who reveals to her the most extraordinary things that have ever happened to them, and when the young man in his turn relates the strange passages of his life she seizes him; but he cunningly slips his brother’s dead hand into hers, and so escapes. The king is so much struck with wonder and admiration that he promises the clever thief his daughter in marriage, since he surpassed all mankind in knowledge; for, while the Egyptians surpassed all the world, he surpassed the Egyptians.

Such is the oldest recorded version of Asbjörnsen’s ‘Master-thief’ and Campbell’s ‘Shifty lad,’ Dr Barbu Constantinsson’s Romanian gypsy story of ‘The Two Thieves,’ a variant of the story of Trophonios and Agamedes in the treasury of Hyrieus at Hyria (Paus. ix. 37), of Angelines in Ellis, and of Hermes (φρούς φλαγγών), as well as of the Hindu legend of Kārpara and Gata, or that of Ali Baba and the Forty Thieves in the Arabian Nights. The story occurs in the oldest version (12th century) of the romance of the Seven Wise Masters, the Dopanothis, sive de Rege et Sepulchro, translated into Latin which Sophia of Brunswick derived the story as found in his Pecorone (written circa 1378), where it is related of an architect named Bindo who stole a golden vase from the treasury of the Doge of Venice. It will be found, more or less perfect, in every collection of European folk-tales, German, French, Breton, Albanian, Sicilian, Hungarian, Dutch, Tyrolese, Danish, or Russian, as well as Kabiyl, Mongolian, Tibetan, and Sinhalese.

Maspero defends the story as fundamentally Egyptian. His account is the version of Herodotus, in spite of the Greek dress in which the historian has clothed it. It has been objected by some that the idea of a movable stone is not Egyptian, and is but ill adapted to the size of the stones used in building; but at Dendera have
been found a series of crypts communicating with the temple by narrow passages formerly opened and closed in a similar manner, the stone sculpturing of this half-shrubby plant is in keeping with the view that the temple was adorned with plants. Wilkinson objected that the soldiers wore no bears; but his relief and statues show that Egyptians of pure race wore bears according to individual taste; and besides the soldiers of police in question belonged to a tribe of Libyan origin, named Mazion, whose natural emblem was the bear.

See Liebrecht's translation (1851) of Dunlop's History of Free Fiction; A. Schieffer in vol. xiv. of the Bulletin of the St Petersburg Academy of Sciences; W. A. Clouston's Popular Tales and Fictions (1887); and Manuscript de Contes Populaires de l'Egypte Ancienne (2d ed. 1889).

**Rhapsodists** (Gr., from ῥαψαίνειν, 'to stitch together,' and ὄδὲ, 'an ode'), a class of men in ancient Greece who travelled from place to place reciting poetry. They are distinct from the professional minstrels (nautaës) of the Odyssey, although their legitimate successors; but they also seem, at first at least, to have been composers of epic poetry, although it is hardly probable that this was often the case after the 6th century B.C. We find distinct traces of the public recitation by rhapsodists of the Homeric poems at an early date, as at places so far apart as Sicyon, Symecon, Delos, Chios, Cyprus, and Athens. Indeed at Athens ancient law prescribed the recitation of Homer once every four years at the festival of the Great Panathenae. To the early rhapsodists mainly belongs the credit of the wide diffusion of the Homeric poems throughout the Greek world. They themselves were held in high esteem and richly rewarded; but in later days the art came to be practised in a mere mechanical manner, and the influence of the rhapsodists ebbed accordingly. In Plato's Ion we get a picture of the rhapsodist at his work about the middle of the 4th century B.C. Ion is a native of Ephesus who goes from city to city reciting Homer to crowds of hearers, appearing on a platform in a richly-embroidered dress, a golden wreath on his head. He adds dramatic force to his declamation, and brings Homer home to his hearers' hearts, being himself possessed by Homer. Moreover, he interprets Homer in a continuous exposition, and is proud of his fluency of ideas. Ion is described as devoted exclusively to Homer, but there were a few of his bretheren who gave themselves also to a greater degree to Muses, Hermes, or Simonides. It is unlikely that Homer was ever sung to music, although in earlier times there were heroic lays which were sung to the accompaniment of the lyre. As lyric poetry became more distinctly cultivated, such epic lays came to be simply declaimed, the rhapsodist holding a branch of bay in his hand instead of a lyre.

**Rhatany**, or Rattany, a half-shrubby plant, of the natural order Polygala, a native of the cold sterile table-lands of the Andes in Peru and Bolivia. It is called Rhatanich in Peru. It is used in medicine as a stimulant property of the root which are shared more or less by other species of the same genus, also natives of South America. In the British Pharmacopoeia the dried roots of two species (Krameria triandra, Peruvian Rhatany, and K. zinja, Savannial Rhatany) are official and interchangeable. These roots have a good deal in size and thickness, but are always rough-looking, and reddish in colour. The bark has a strongly astringent taste, and when chewed tingles the saliva; the wood is nearly tasteless. The dried root is a powerful astringent, and is employed in the treatment of haemorrhages, partial haemorrhages, and cases where an astringent or styptic action is indicated. The finely-powdered root is also a frequent constituent of tooth-powders.

**Rhatany** root is imported from various parts of South America, but chiefly from Lima. It is extensively imported into Portugal in order to communicate a red colour to wines. Its peculiar properties are due to rhatany-tannic acid, found in the root-bark to the extent of 20 per cent.; it also contains a red colouring matter.

**Rheas**, or Râzî, Persian physician and alchemist. See Medicine (p. 367) and Arabia (p. 369).

**Rhé, l'ile de**. See Ré.

**Rhea**, an ancient Cretan earth-goddess, daughter of Uranus and Gaea, wife of her brother the Titan Cronus, and by him mother of the Olympian deities Zeus, Hades, Poseidon, Hera, Hestia, Demeter. She was early identified with the Asiatic nature-goddess Cybele, the Great Mother, who was worshipped on mountains in Mycia, Lydia, and Thrasyia. Her Cretan Curetes corresponded to the Phrygian Corybantes, many of whom imitated themselves like Attis in the frenzy of their orgies. The regular priests of Cybele, the Galli, made themselves eunuchs for conscience' sake. A Sibyl-line oracle decreed the introduction of the worship of the Great Mother at Rome in 264 B.C., and in 217 B.C. a temple was dedicated on the Aventine, and the cult became widely extended under the Empire. In the 21st century A.D. the rites of the Tarabollia and Criobolia were added, in which candidates were baptised for purification and regeneration with the blood of sacrificial bulls and rams. See the article CYBELE.—*Rhea Sylvia* was the mother of Romulus (q.v.).

**Rhea**, also called Nandi and American Ostrich, a genus of South American birds, which form, according to the most recent researches, a somewhat isolated group, though nearer to the ostriches than to any other birds. They are incapable of flight, and are as large as the ostrich, or larger, although generally smaller than in any other of the so-called 'Struthions' birds; they present an interesting austral character in the persistence of a claw upon each of the three digits, thus recalling very forcibly the origin of the wing from a prohensile forelimb. As in the ostrich and the apteryx, the feathers have no after-shaft, and the colour of the eggs is white. The male bird incubates. There are three distinct species—viz. *R. americana*, *R. macrorhyncha*, and *R. Darwinii*, which are to be distinguished by their geographical range as well as by external and internal features. A few of these birds inhabits the southern half of the continent. *R. macrorhyncha*, which is darker coloured, especially on the head, is found in north-east Brazil. *R. Darwinii*, in which most of the feathers have white tips, is found in south-eastern South America. They all prefer grassy plains (campos), herd in troops, and run with great rapidity.

**Rhea Fibre**. See BOHEMIA.

**Rhégium**. See REGGIO.

**Rheims**, or REIMS, a city in the French department of Marne, a site of the Roman town of Vesuz (a tributary of the Aisne), 100 miles ENE. of Paris by rail. Strongly fortified with detached forts since the Franco-German war, when it was for a time the German headquarters, it is well built, and from the material employed in building, which is the chalkstone of the region, rather better developed than in any other of the older style of domestic architecture, has a picturesque appearance. It is built on the site of Dorobvrorum, which is mentioned by Caesar as the capital of the Remi, from which people it subsequently took its present name. Christianity may have found an entrance in A.D. 50, and by 150 the province of the Olympic deities was not till about 390 that it became a bishop's see. Under the Frank rule it was a place of much importance, and it acquired a deeply religious
interest from its having been the scene in 496 of the baptism of Clovis and his chief officers by the bishop, St. Pirmin, and in 1443-1454, when Philip Augustus was solemnly crowned here, it became the place for the coronation of the kings of France, who were anointed from a vessel of sacred oil, called the Sancta Ampulla; which a dove was said to have carried from Remi from heaven. Joan of Arc brought the dauphin hither, and the only sovereigns in the long series, down to 1825, not crowned at Rheims were Henry IV., Napoleon I., and Louis XVIII. In 1793 the cathedral was attacked by the populace, and the sainte ampoule smashed by a sance-cloître; and in 1830 the ceremony of coronation at Rheims was abolished. The cathedral, although the towers of the original design are still unfinished, is one of the finest extant specimens of Gothic architecture. It was built between 1112 and 1490, and in 1177 the government voted 500,000 towards the restoration. Its nave is 466 feet long by 99 in breadth, with a transept of 160 feet, and the height is 144 feet. Its grandest features are the west façade, which is almost unrivalled, with its magnificent doorway (figured in Vol. I. p. 59), called Angel Tower, which rises 59 feet above the lofty roof. The stained glass is remarkable for its beauty; the organ is one of the finest in France; and two survive out of six magnificent tapestries. The Romanesque church of St. Remy (mainly 1160-80), with the saint’s shrine, is nearly of equal size, but of less architectural pretension. Also noteworthy are the hôtel-de-ville (1827-1880); the ancient ‘Maison des Musiciens’ and archiepiscopal palace; the Porta Martis, a Roman triumphal arch; the Lycées, representing a former university (1547-1793); and the statues of Louis XV. and two nates, Colbert and Marshal Ducrot. Rheims is one of the principal entrepôts for the wines of Champagne (q.v.), and the hills which surround the town are planted with vineyards. It is one of the great centres of the woollen manufacture in France, and its manufactures, embracing woollen goods (especially merinoes), mixed fabrics in silk and wool, &c., are known in commerce as Artiches de Rienz. Pop. (1872) 71,307; (1891) 101,699. See the article DOUAY; and Justinus, Rheims, la ville des sacrés (1800).

Rheingau, a district, 14 miles long, stretching along the right bank of the Rhine, from opposite Mainz to the village of Lorch, 8 miles below Bingen, formerly belonged to the archbishopric of Mainz, and now forms part of the administrative district of Wiesbaden in Prussia. Protected by mountains, from the north and east winds, and exposed to the mid-day sun, the Rheingau produces wines of the best quality, as Johannisberger, Rüdesheimer, Marcellenm, Assmannshäuser, &c.

Rhenish Architecture, the style of the countries bordering on the Rhine when the arts first revived after the fall of the Roman empire. They and Lombardy being at the time of Charlemagne part of the same empire, Lombard Architecture (q.v.) has considerable affinity with those north of the Alps. Some very early examples of this style are still to be found in Switzerland. Architecture received great encouragement from Charlemagne and his successors, and the Rhenish style made great progress up to the beginning of the 13th century, when the fashion of copying the Gothic architecture of France superseded it. It is, however, a well-marked style, and is complete and perfect in itself. Like the Lombard style, it is round-arched, and has some remarkable peculiarities. Many of the earliest churches seem to have been circular (like the cathedral at Aix-la-Chapelle, built by Charlemagne), but in course of time the circular church was absorbed into the Basilica, or rectangular church (see ROMANESQUE ARCHITECTURE), in the form of a western apse. Most German churches thus have two apses—an eastern and a western. They also have a number of the circular towers, or octagonal towers, which seem to be similar to origin in the Round Towers of Ireland. They exemplify in a remarkable manner the arrangements of an ancient plan of the 9th century, found in the monastery of St Gall, and supposed to have been sent to the abbot, as a design for a perfect monastery, to aid him in carrying out his new buildings. The arcaded galleries at the caves, and the richly-carved capitals, are among the most beautiful features of the style. Examples are very numerous from about 1000 to 1200 A.D. The three great specimens of the style are the cathedrals of Mainz, Worms, and Spires. The last is a magnificent building, 435 feet long by 125 feet wide, with a nave 45 feet wide, and 102 feet high. It is grand and simple, and one of the
most impressive buildings in existence. There are also numerous fine examples of the style at Cologne—the Apostles' Church, St. Maria im Kapitol, and St. Martin's being amongst the most finished examples of Rhenish architecture. The illustrations of the church of the Benedicente abbey at Iaech, near Coblenz, explain the peculiarities of plan and elevation above referred to. The vaults in this case being small, the different spans were managed (although with round arches) by stitling the springing; but in great buildings like Spires and Worms the vaults are necessarily square in plan, in this round-arched style, and the nave embraces in each of its bays two arches of the side aisles—a method also followed by the early Gothic architects. From the use of the round arch and solid walls, the exteriors are free from the great mass of buttresses used in Gothic buildings, and the real forms are distinctly seen (see APSE).

Rhenish Prussia (Ger. Rheinprovinz, Rheinland, or Rheinpreussen), the most western and most thickly populated of the provinces of Prussia, lies on both sides of the Rhine and the Lower Moselle, and is bounded on the W. by Luxemburg, Belgium, and the Netherlands. Long and narrow, it extends from Cleves in the north to Straßmünd in the south, has Cologne near the middle of its area, Aix-la-Chapelle (Aachen) and Treves near its western boundary, and Coblenz (the capital), Elberfeld-Barmen, and Essen near its eastern boundary, whilst Bonn lies south-east of Cologne, and Düsseldorf and Crefeld N. by W. of it. Area, 10,419 sq. m.; pop. (1885) 4,344,027; (1890) 4,710,313, of whom about 3,400,000 are Roman Catholics, and 10,000 Walloons. The surface is everywhere more or less mountainous, except in the extreme north, reaching 2000 feet on the west of the Rhine, but only 1800 on the east side. The soil of the higher tracts is not very fertile, and is largely forest land; but the valleys of the Rhine, Moselle, and Nahe are very fruitful, and so are the flat districts in the north. Of the total area, 64 per cent. is cultivated, including meadows and vineyards, and nearly 51 per cent. under forest. Grain, potatoes, beet-root, tobacco, hops, flax, &c., are the more important crops. Much wine and large quantities of vegetables are grown. More than sixteen million tons of coal are mined in the year, also large quantities of iron, zinc, and sulphur acid (at Essen, Siegen, Remscheid, &c.); cloth and buckskin (Aix-la-Chapelle and Burscheid) have a European reputation. Industry and manufactures are presented with the greatest energy and success, this province ranking first in all Prussia in this respect. Iron, lead, zinc, and sulphuric acid (at Essen, Siegen, Remscheid, &c.); cloth and buckskin (Aix-la-Chapelle and Burscheid); silk, velvet, and similar wares (Crefeld, Elberfeld-Barmen, Mülheim), cottons (Cologne, München-Gladbach, and Elberfeld-Barmen), linen (Gladbach and Nen), leathers (Malmedy), glass and pottery, paper, chemicals (Duisburg, Aix-la-Chapelle), soap, sugar, beer, spirits, and perfume (eau de Cologne) are all manufactured on a large scale. There is a university at Bonn. This province was formed in 1815 out of the duchies of Cleves, Jülich (Juiliers), Guelders, and Berg, and numerous minor territories. It is defended by the four fortresses of Cologne, Coblenz (Ehrenbreitstein), Wesel, and Saarbröich.

Rheostat, the name given by Wheatstone to an instrument for varying an electric resistance between given limits. Many forms have been suggested and used by Pouillet, Jacobi, Poggendorf, Wheatstone, and others. The most serviceable is the patent of W. Thomson, in which the combination of Wheatstone's double-cylinder rheostat. In it a platinum or platinoid wire is wound round the two parallel cylinders, one of which is metal and the other of some insulating material. In any position the part of the wire which is effective as a resistance is the part that is on the insulating cylinder up to where it comes in contact with the metal cylinder. By means of a gearing of toothed wheels and screw shaft the two cylinders are turned simultaneously in one or the other direction, while at the same time a nut travels to or fro and guides the wire as it leaves the one cylinder and calls itself round the other. See ELECTRICITY.

**Rhesus Monkey**, or Bonder (Macacus rhesus), a widely distributed and common Indian monkey. Like the Entellus (q.v.) or Hanuman, it is in part migratory, visiting the Himalayas in summer, and sometimes found at a level of 8000 feet. The body is stout, the limbs are strong, the skin hangs in loose folds about the neck, breast, and abdomen. The hair is grayish or brownish on the back and lighter beneath; the naked parts are copper-coloured; the large ishial callouses are bright red. It is a very intelligent and mischievous monkey, and readily tamed when young. It is held in almost as great veneration by the natives of India as the Hanuman itself; and the killing of one of these animals is apt to arouse the greatest popular indignation. The monkeys live in troops in the forests, chiefly in hilly districts, and visit the cultivated grounds to carry away grain and other produce, which they store up for themselves among rocks. The native farmers leave a share for the monkeys, believing this to be necessary to avert their anger, as otherwise they would next year destroy the whole crop whilst green.

**Rhetoric** (Gr. rhētorikê) in its broadest sense may be regarded as the theory and practice of eloquence, whether spoken or written. It aims at expounding the rules which should govern all prose composition or speech designed to influence the judgments or the feelings of men, and therefore treats of everything that relates to beauty or force of style, such as accuracy of expression, the structure of periods, and figures of speech. But in a narrower sense rhetoric concerns itself with a consideration of the fundamental principles according to which particular discourses of an oratorical kind are composed. The first to reduce oratory to a system were the Sicilian Greeks; its actual founder is said to have been Corax of Syracuse (c. 500 B.C.). He divided the speech into five parts, prose, narrative, arguments, subsidiary remarks, and
RHEUMATISM

peroration; and he laid great stress on the rhetorical capabilities of general probability. Later masters of rhetoric were Tissias; Gorgias of Leontini, whose style was burdened with too much ornament and antithesis; Antiphon, the earliest of the sophists, the father of modern law, and the first writer of speeches for others to deliver in court. The speeches given by his great pupil Thucydides throughout his history, and the orations of Andocides, second of the Ten, are severely free from the florid ornament of later days. Lysias was an orator rather than a rhetorician. He appears to have been thoroughly taught rhetoric, which he defined as the 'science of persuasion,' as a technical method and discipline. His most celebrated pupils were Hyperides, Speusippus, and Isaeus. The great Demosthenes was a pupil of the last. His opponent, Euxines, and his contemporaries Hyperides, Lyceurgus, and Dinarchus complete the Ten.

Anaximenes of Lampscus composed the oldest extant manual of rhetoric, but the great classical work on this subject is the analytical masterpiece of Aristotle. According to him its function is not to persuade, but to discover the available means of persuasion in any subject. He regards it as the counterpart of logic, and arranges its uses as (1) the means by which truth and justice assert their supremacy over falsehood and injustice; (2) the only method of persuasion which secures the audience; (3) a means of seeing both sides of a case and of discerning the weakness of an adversary's argument; (4) a means of self-defence. The means of persuasion he groups in two classes: (1) the means of important propositions, such as reasons, witnesses, contracts, and the like; (2) the artificial devices, whether these are (a) logical, demonstration or seeming demonstration by argument; (b) ethical, when the speaker induces confidence by the weight of his own character; or (c) emotional, when he works the feeling of his hearers.

Of these artificial proofs, first comes the logical, and this depends on the enthymeme, 'a syllogism from probabilities' and signs; next is the example. Of the materials of enthymemes, the topics or commonplaces of rhetoric, Aristotle distinguishes between the general and the special or applicable to all subjects as to their possibility or impossibility, and the special, those drawn from special arts or faculties.

He divides the three provinces of rhetoric thus: (1) the forensic or rhetorical concerning with exhortation or dissuasion, and future or present time; ends expediency and inexpediency; (2) Forensic rhetoric, concerned with accusation or defence, and with time past, its ends justice and injustice; (3) Epideictic rhetoric, concerned with eulogy or censure, and usually with time present, its ends being honour and disgrace, or nobleness and shamefulness. In his first two books Aristotle deals with invention, the discovery of means of persuasion; in the third, with expression and arrangement; and he begins the subject by discussing the art of demonstration or of proof. Under ethical division he discusses the use of metaphor, simile, proverbs, rhythm, and variety of styles, as the literary and controversial, whether the political or the forensic.

Aristotle's method dominated the Peripatetic school, but later began to be modified by the florid influence of the Cynics. As the orator, Hegesia of Magnesia. The school of Rhodes followed more closely Attic models, and gained great fame through its conspicuous leaders Apollonius and Molon (c. 100-50 B.C.). Hermogenes of Tarent delivered the 'Ten Attic Rhetoricians,' which long retained its influence. Later rhetoricians were Dionysius of Halicarnassus, Longinus, Hermogenes, Apelles, Menander, Theon, and Aphthonius. Among the earliest Roman orators were Appius Claudius Cæsus (c. 300 B.C.), Cato the Censor, Ser. Sulpicius Galba, Caius Graceæus, Marcus Antonius, and Lucius Licinius Crassus. The instructors in formal rhetoric were Greek, and the great masters of theoretical and practical rhetoric alike. Cicero, Quintilian, and Orison, were formed by Greek models. The former contributed to a discussion of its theories no less than three treatises, De Oratore, the Brutus, and the Orator: the latter's famous Institutio Oratoria still retains its value. Quintilian strove hard to reform the taste of the times, and he gives first place through exclusive attention to the form and perpetual exercises in the schools on imaginary subjects—the suasorius and controversius of the elder Seneca. The Dialogus de Oratoribus, long ascribed to Tacitus, was another protest against modern fashion and abuse. In the twelfth century, long remained a model for later orators. During the first four centuries of the empire rhetoric continued to be taught by 'sophists' at Athens, Smyrna, Rhodes, Tarsus, Antioch, Alexandria, and Marseilles, and thence spread to other cities. Hadrian, the Antonines, and Marcus Aurelius, among the most celebrated were Tácceotus, Pólenon, and Adrian of Tyre. Throughout the middle ages rhetoric formed one of the subjects of the triensium; its leading authors were Martinaeus Capnellus, Gellius, and Justinian. These and other masters, of whom the most illustrious is Longinus, taught that the subject re-awoke with the revival of learning, and was taught regularly in the universities, the prescribed public exercises and disputations keeping it long alive; but in later generations it has constantly languished, in spite of more or less laborious or effective attempts to fan it into life by such as the pre-eminent Blair, the solid Campbell, and the sagacious Whately. In America, however, considerable attention is paid to it as a branch of general education.

See Aristotle's Rhetorique, with notes by E. M. Cope and J. E. Tandy (3 vols. 1877), The Introduction, and Analysis by E. M. Cope (1867), and Translation by J. E. C. Weldon (1886); C. Ritter, Die Quintilianische De- klation (1811); R. Volkman, Die Rhetorik d. Gr. (1872); Book iv. of St. Augustine's treatise On Christian Doctrine; and J. Bascom's Philosophy of Rhetoric (New York, new ed. 1885). For the practical art of Rhetoric or Oratory, see M. Bautin, The Art of Eloquence (New York, 1885); A. Pinkly, The Essentials of Eloquence and Oratory (New York, 1884); and C. W. Theodore, Rhetoric (1884).

Rheumatism (from the Gr. rheuma, 'a flux') is a term which has been, and still is, rather vaguely and extensively used in the nomenclature of disease. But there is one very definite affection to which it is always applied; after this has been discussed the other senses in which it is used will be considered separately.

Acute rheumatism or rheumatic fever is indicated by general febrile symptoms, with redness, heat, swelling, and usually very intense pain, in and around one or more (generally several, either simultaneously or in succession) of the larger joints, and the disease is terminated by which sets in to joint or to certain internal serous membranes, especially the pericardium and the endocardium; rheumatism being the most common origin of periarticular, as has been already shown in the article on that subject. If prevented from reaching the joint there is headache, but seldom delirium, unless in very severe cases; the tongue is covered with a creamy thick fur, the tip and edges being red; the urine is turbid, and abnormally acid; and the skin
Rheumatism

is bathed in a copious perspiration, with so characteristic a smell (resembling that of sour milk) that the physician can often recognize the disease almost before he sees the patient. The joints are extremely painful, and the pain is much increased by pressure, and consequently by movement which gives rise to internal pressure. Hence the patient lies fixed in one position from which he dares not stir.

The usual exciting cause of acute rheumatism is exposure to cold, and especially to cold combined with moisture, and hence the greater prevalence of the disease in the Northern States. Sitting in damp sheets or upon the damp ground, the wearing of wet clothes, and sitting in a cold damp room, especially if the sitter was previously warm from exercise, are examples of the kind of exposure which is apt to be followed by this disease. Rheumatism is not, however, a universal sequence to exposure to the cold. It only occurs when there is a special predisposition, or, as it is termed, a rheumatic diathesis or constitution, and the diathesis may be so strongly developed as to occasion an attack of acute rheumatism, independently of exposure to cold. Acute rheumatism is often associated with Chorea (q.v.); but the exact nature of the relation between the two is not known. Scarlet fever is the only other disease which seems specially liable to be followed by acute rheumatism. Men are more subject to the disease than women, and children under ten years being comparatively seldom attacked, while the disease is most prevalent between the ages of ten and forty. Again this age is a frequent and important cause. Acute exposure to atmospheric changes on account of the nature of their occupations. The predisposition is certainly affected by age; children under ten years being comparatively seldom attacked, while the disease is most prevalent between the ages of ten and forty. Acute rheumatism is rare, and even recurrences are less frequent than earlier in life. Persons once affected become more liable to the complaint than they previously were. The disease is hereditary in a considerable proportion of cases; and even when it cannot be traced in previous generations the predisposition is very apt to exist in several members of the same family. The exact nature of the disease poison is unknown. Dr Prout regarded lactic acid as the actual materiis morbi, but, though certain facts tend to confirm this view, it cannot be regarded as satisfactorily proved.

In the great majority of cases acute rheumatism ends in recovery; and permanent damage to the affected joints is rare. It is, however, extremely apt to recur, either in the early stages of convalescence, or after an interval of months or years. The chief danger arises from implication of the heart, which very frequently occurs; probably in about one-half of those suffering for the first time either the pericardium or endocardium or both are affected. The younger the patient the greater the liability to these complications, which usually result in more or less permanent impairment of the heart's action (see Heart, PERICARDIUM). Another condition, much less common, but extremely fatal, is known as rheumatic hyperpyrexia, and is characterized by a very rapid rise of temperature to 108° or even 110°; it is of a fulminating form, the term either of drowsiness or of violent delirium.

The patient should be strictly confined to bed between blankets (i.e. without sheets), and be clothed in flannel; he must be carefully protected from draughts, and from undue pressure of the bedclothes. He should be kept well supplied with hot and blisters. Under such conditions, without other treatment, most cases recover in the course of time. Till the last quarter of the 19th century there was no general agreement as to what more should be done. When bleeding was used for most acute diseases this one was no exception. When that practice was abandoned numerous drugs were used, in some cases with apparent success. Quinine, iron, lemon juice, colchicum, large blisters to all the affected joints, were all recommended; more in favour than any of these were alkalis in large doses. But in 1870 Stricker in Berlin and MacIagan in England called attention to another method of treatment which is now almost universally adopted. Though new to Europe it has long been in use elsewhere, for the natives of South Africa have from time immemorial treated the disease by willow-top infusion. This method consists in the administration of Saliea (q.v.), or one of its derivatives (salicylic acid, salicylate of soda, &c.). The last is at present most largely used. It is usually given in doses of 15 or 20 grains every two or three hours at first; but its action needs to be carefully watched, as it often causes considerable depression and other uncomfortable symptoms. It is administered by almost all observers that it has a remarkable effect in reducing the fever, relieving the pains, and cutting short the attack; but under this treatment, as without it, relapses are frequent. In rheumatic hyperpyrexia the only treatment that has been found effective is to lower the temperature as the temperature rises to a dangerous point. Convalescence is usually very slow, and it is necessary to keep the patient in bed and on low diet for some time after the fever has disappeared to diminish the tendency to relapse. At this stage tonics, especially quinine and iron, are used, and a greater exposure to atmospheric changes on account of the nature of their occupations. The predisposition is certainly affected by age; children under ten years being comparatively seldom attacked, while the disease is most prevalent between the ages of ten and forty. Acute exposure to atmospheric changes on account of the nature of their occupations. The predisposition is certainly affected by age; children under ten years being comparatively seldom attacked, while the disease is most prevalent between the ages of ten and forty. Acute exposure to atmospheric changes on account of the nature of their occupations. The predisposition is certainly affected by age; children under ten years being comparatively seldom attacked, while the disease is most prevalent between the ages of ten and forty.
RHEUMATIC DISEASES OF ANIMALS.—These are less common than the corresponding affections of men. Horses are not very liable to acute rheumatism, but suffer from a chronic variety, which proceeds in after the fever and influenza. When affecting the limbs it often exhibits its characteristic tendency to shift from one part to another. In cattle and sheep rheumatic disorders are more common and acute than in horses. The specific inflammation sometimes involves most of the fibrous and fibro-serous textures throughout the body, inducing general stiffness, constipated bowels, and high fever. This is rheumatic fever—the chine-felon or body-garget of the old farmers. Sometimes the disease mainly affects the larger joints, causing intense pain, lameness, and hard swellings; occasionally it is confined to the feet and fetlocks, when it is recognised as bastian-foul. Cattle and sheep on bleak exposed pastures, and cows turned out of the dairy to feed on strong alluvial grazings are especially subject to rheumatism in its several forms. Amongst dogs rheumatism is known under the name of kennel lameness, and is very troublesome and intractable in low, damp, cold situations. Blood-letting is rarely admissible except in the most acute cases amongst cattle. In all animals a laxative should at all times be given; and stimulants such as aconite, and colchicum, and when the pain and fever are great a little tincture of aconite may be added. For cattle a good combination consists of one ounce of nitre, two draehms of powdered colchicum, and two fluid draehms of the Pharmacopoeia tincture of aconite, repeated in water or gruel every three hours; half this dose will suffice for horses. With a simple laxative diet dogs should have a pill night and morning containing five grains of nitre and two of colchicum. Comfortable lodgings, a warm bed, horse-rugs on the body, and bandages on the limbs will greatly expedite a cure. In chronic cases, or after the more acute symptoms are subdued, an ounce of oil of turpentine and two draehms each of nitre and powdered colchicum should be given for a cow, half that quantity for a horse, and one-fourth for a sheep. Harshin and oil, or other stimulating embrocations, diligently and frequently rubbed in, will often abate the pain and swelling of the affected joints.

Rheyd, a town of Rosenh Prussia, 19 miles by rail W. by S. from Düsseldorf, has manufactures of silks, velvets, cottons, machinery, hardware, paper, blankets, dyeworks, and breweries. Pop. (1889) 19,687; (1890) 23,692.

Rhine. See RHYME.

Rhin. Bas and Haut, until 1871 frontier departments of France, corresponded pretty nearly to what are now the two administrative districts of Lower and Upper Alsace, in the German imperial territory of Alsace-Lorraine (q.v.)—Bas Rhin corresponds to Lower Alsace, and Haut Rhin to Upper Alsace. See also BERTHOF.

Rhine (Ger. Rhein, Fr. Rhin, Dutch Rhijn, Lat. Rhenum), in every way one of the most important rivers of Europe. A large number of rivulets, issuing from glaciers, unite to form the young Rhine; but two are recognised as the principal sources; the first, or eastern Rhine, former emerges on the north-east slope of the Gotthard knot (7690 feet above sea-level), and only a dozen miles from the cradle of the Rhine, on the other side of the same mountain-knot; the Farther Rhine, or western Rhine, as it is sometimes called, with a length of 1230 feet (7270 feet), not far from the Pass of Bernadino. The two mountain-torrents meet at Reicheinan, 6 miles SW. of Coire (Chur) in the Grisons canton, after they have descended, the Nearer Rhine 3577 feet in 29 miles in a north-easterly direction, theFarther Rhine 5347 feet in 27 miles along a northerly course. At Coire the united stream strikes due north, and, after plunging its way for 45 miles between Switzerland and Austrian Vorarlberg, enters its first lake, the Lake of Coire (1306 feet above the sea). It leaves this lake at its north-western extremity, a little below Constance, its water a deep transparent green, and flows generally westwards, in three or four wide curves, to Basel, separating Baden on the north from Switzerland on the south. At Basel the river (490 feet wide) plunges down the falls of Schaffhausen, nearly 70 feet in three leaps, and races over narrow rapids at three separate places where the terminations of the Jura Mountains intrude into the valley; from these falls it receives the waters of the Swiss Aar. Basel is 290 miles distant from the source of the Nearer Rhine following the windings of the channel, but only 85 miles as the crow flies.

At Basel (742 feet) the river, now 225 yards wide, rounds to the north, and traversing an open shallow valley that separates Aalst and the Bavarian Palatinate from Baden, reaches Mainz (50° N. lat.) in Hess-Darmstadt, north-east from Basel. This valley is fenced in by the Black Forest on the east and by the Voges on the west, and among their ridges and halts Millhausen, Colmar, Strasbourg (on the Ill, 2 miles from the Rhine), Gernersheim, Spiez, Ludwigshafen, and Worms, all on the Alsatian side, and Freiburg, Baden, Rastatt, Carlsruhe, Mannheim, Heidelberg, and Darmstadt on the opposite side of the river. Along this section the Rhine splits into many side arms that flow parallel to the main stream, and is studded with green islands. Navigation, however, which begins at Basel (although boats ply for short stretches on the upper waters above that town that are higher, and others, higher still), is facilitated by artificial means, in that the current is made to flow in a carefully kept, straightened channel. Of the numerous affluents which add their waters to the volume of the Rhine along this section the largest are the Neckar and the Main, both coming from the right, and both navigable; the Ill, which falls into it from the left, is also navigable. A little below Mainz the Rhine (685 yards wide) is turned west by the Taunus range; but at Bin gen it forces a passage through, and pursues a north-westerly direction across Rhinen Prussia, parts of Hesse, part of Bavaria, part of the Ruhrort, and Wesel as far as the Dutch frontier, which it reaches a little below Emmerich, and opposite Cleves; here it is 1875 yards wide and 36 feet above sea-level. The first half of this portion of the river from Bingen to Bonn is the Rhine of song and legend, the Rhine of romance, the Rhine of German patriotism. Its banks are clothed with vineyards that yield wine esteemed the world over (see below); the rugged and fantastic crags that hem in its channel are crowned by ruined castles; the tresserns and cliffs of the Vibelung, and the rapids of the river, but higher up, at Worms; the Binger- loch (see BINGEN) and the Mouse Tower of Bishop Hatto, the fortress of Ehrenbreitstein, the rock of the siren Lorelei, the commanding station of Germany (the trophy of German victory in 1870), and numerous other romantic and historic spots. Of the Rhine, which is the middle course of 'Father Rhine,' as his German children call him. It still inspires them, as in 1870, when Max Schneckenburger's Wacht am Rhein (written in 1849; the music by K. Wilhlem, 1854) was sung by them, the grandest and most martial of the German citizens as they looked into France. There is the Rheinlied, too, of Nikolaus Becker, with Alfred de Musset's retort, Nos Pavons en, vôtre Allem ont, both of them written in 1841. Between Bingen and Bonn the steep rocky walls that fence
the river approach so closely together that in many places there is not room for the carriage-road and the railway to run alongside; they have to find a way through tunnels. Mainz (260 feet) is the head of steamboat navigation from Rotterdam. The Nahe enters the Rhine at Rüthen, the Moselle at Coblenz; from the opposite (right) side the Lahn enters just above Coblenz. A few miles beyond the Rhine rafting rafts are formed out of smaller ones, floated down from the Black Forest and the woods towards Lorraine and the Palatinate, and are then steered by the numerous men who live on them right down to Dordrecht in Holland, where they are sold. Below Bonn the Rhine is joined by the Sieg, Wupper, Ruhr, and Lippe, all from the right.

At Bonn the river enters the plains, and almost immediately after passing the Netherlands frontier its delta begins. The principal arm, carrying two-thirds of the volume, flows under the name of the Waal, and later the Mermele, due west past Nimegen until it reaches Dordrecht. East of the Biesbosch it picks up the Maas (Meuse) from the left. At Dordrecht the river again divides, one branch, the old Maas, running out to sea; the other, the Nörd, going to Rotterdam. To the mouth of this town it is joined by the Lek, another main arm of the deltaic complex, and below which town it once more unites with the Old Maas. The arm that strikes out northward at the point where the delta begins soon divides, sending one branch, the Yssel, due south to Rotterdam. The other arm runs to the east side near Kampen; the other branch is the Lek, which runs into the Waal-Maas arm above Rotterdam. A thin stream called the ‘Winding Rhine’ leaves the Lek half-way between Arnhem and Rotterdam; but it again splits at Utrecht into two branches. It is the stream with a perennial current, comparatively speaking, manages with the help of a canal and locks to struggle into the North Sea at Katwyk, a little to the northwest of Leyden, while the other channel, the Vecht, flows due north from Utrecht until it enters the Zuider Zee, a short distance from Amsterdam. For considerable distances in these delta regions the rivers are only kept from overflowing the country by artificial banks or dykes. The area drained by the Rhine is estimated to be 75,773 sq. m., making its total length be 766 miles, of which 350 in all are navigable. By means of the Lüneburg Canal it is connected with the Danube; the Rhine and Rhine Canal unites it with the IJssel, and so with the Mediterranean; another canal provides a waterway between it and the Meuse, a tributary of the Seine; and yet a fifth unites it with the Zuider Zee at Amsterdam. The fisheries of the Rhine are of considerable importance; salmon, carp, pike, sturgeon, and lampreys—the fish of greatest value—are taken principally near St Goar, between Bingen and Coblenz. The waters are partly re-stocked from the fish-hatcheries of Hühningen in Upper Alsace (see Pisciculture).

Commercially and historically the Rhine is one of the principal rivers of Europe. It was the Romans’ strongest bulwark against the Teutonic invaders, and afterwards it encouraged commerce to travel up and down its waters, and kept its channel open. Under Charlemagne the ravages caused by the Teutons having broken through the Roman girdle along the Rhine and inundated Gaul were rapidly obliterated, and the Rhine was the principal means of civilization in the early empire. Except between 1897 and 1871 the Rhine was always a purely German river; at the peace of Ryswick, Alsace-Lorraine was appropriated by France, and the Rhine became part of the dividing line between France and Germany. In 1801, Napoleon incorporated the mouth of the left bank with France; and in 1815 the arrangement in force before 1801 was restored; and after 1871 the Rhine became once more wholly German. From the days of the Roman supremacy down to the beginning of the 19th century navigation was always more or less hampered by the riparian sovereignty along the greatest part of the time a large number of riparian privileges, which, by levied vexatious dues upon the shipping that sailed up and down past their towns and villages. From 1803 all the powers concerned, except Holland, abolished most of the shipping dues on their own territories, but England followed suit in 1833; but it was not until 1st July 1869 that the river was declared an absolutely free waterway to the ships of all nations. The first steamboat churned up its waters in 1817; now some scores ply all the way between Rotterdam and Mainz, and others along other stretches. More than 18,000 vessels of about 2,000,000 tons burden pass the frontier town of Emmenich going up stream every year. There have been various schemes for utilising the mechanical power of the Rhine current by means of turbines and electro-motors. For the practical application (1878) of the latter by taking its name from the Rhine, see Confederation of the Rhine.

Rhine-wine indicates, strictly speaking, the wines produced in the Rheinland (q.v.), the most valuable and costly being those of Castle Johannishain, Rheinauhof, and Mittelrhein. To the south of England promisously to all white Rhine wines), Rüdesheim, Steinberg, Gräfenhain, Ranenthal, Marebbe, Assmannshausen, and Geisenheim. Except the wine of Assmannshausen (Assmannshaus), which is red, these wines are of a white or yellowish tint and are generally either dry or sweet and a dry, piquant flavour. In a wider sense the term Rhine-wine includes the wines of nearly all the valleys lying contiguous to the Rhine—those of Baden, Alsace, the Moselle, Hesse-Nassau, and the Palatinate.

See the illustrated Rhine, by K. Stüeler (Eng. trans. 1878; new ed. 1887); the guidebooks of Murray and Baedeker; Simrock’s Rheinigen (4th ed. 1883) and Das malerische und romantische Rheinland (4th ed. 1885); and the history of the river from the Celtic to modern times, by Meissner and Iserhoven, 1876–79.

Rhinoceros. This genus, representing a distinct family of ungulate mammals, contains only five distinct species, to which another (R. laridus Schlegel) may be perhaps (at present, however, doubtfully) added. These five species are distributed in the hotter parts of the Old World as follows; Africa contains two forms, which are often called the ‘Black’ and the ‘White’ rhinoceros. These terms are, however, very inapt, since both of them are of a greyish black; in colour there is but little difference between R. simus and R. bicornis. They are very heavy, however, he distinguished by other points: the first species is much larger, and has a flat nose and square upper lip, while R. bicornis has the upper lip prolonged so as to enable it to seize and break off branches. Correlated with this structural difference is one of habitat; R. simus ranges in the forests, while the bicornis feeds chiefly upon shrubs. A number of other species have been stated to occur in Africa, but it appears that these ‘species’ have been for the most part founded upon unimportant differences in the length of the two horns with which these animals are furnished. In Asia there are a number of species, some of which are represented by R. unicornis, occurs only in Nepal, Bhutan, and Assam; it is a very big species. A specimen in the Zoological Society’s Gardens measured over 10 feet in length and a little more than 5 feet in height at
the shoulder. It has enormous folds of skin, which give it the appearance of being 'armour-plated.' The African species have a smooth, though of course very thick, skin. The second Asiatic rhinoceros is *R. sondaicus*, which is smaller than the last, though also one-horned; it occurs in Java, Burma, and the Sundarbans near Calcutta. The two-horned Asiatic rhinoceros (*R. sumatrensis*) is found in Malaca, and *R. lesueuri*, from Ceylon, eastern Bengal, is hardly separable from *R. latá* (q.v.). The Asiatic rhinoceroses are distinguished from the African forms by the presence throughout life of functional incisor teeth. Professor Flower has shown that the tooth characters the African species are to be contrasted with the Asiatic; in spite of its two horns, *R. sumatrensis* is more closely allied to *R. unicornis* than to *R. bicornis*; even the fossil species are rendered irreducible for the most part to one or the other group. The Siberian *R. tichorhinos* of one specimen, partly preserved through its being frozen, was found by the Russian naturalist, Pallas, belongs to the African group, which is sometimes separated under the generic name of *Atelodus*.

**Rhinoplastic Operations.** When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. When the whole nose has to be replaced, the following course is usually adopted. A triangular piece of leather or gutta-percha is cut into the shape of the nose, and is extended over the forehead with its base to the temples. When its boundaries, thus flattened, are marked out on the skin with ink. Any remains of the old nose are then pared away, and a deep groove is cut round the margins of the nasal apertures. When the bleeding from these incisions has stopped, the marked portion of the skin of the forehead must be carefully dissected away, till it hangs by a narrow strip between the eyebrows. When the bleeding from the forehead ceases, the flap must be twisted on itself, so that the surface which was originally external may remain external in the new position, and its edges united and fastened with stitches to the grooves prepared for their reception. The nose thus made is to be supported with oiled lint, and well wrapped in flannel to keep up the temperature. When complete adhesion has taken place, the detached strip of skin may be cut through, or a little slit may be cut out of it, so that the skin may be uniformly smooth. Either at the first operation or subsequently a new columna (the front part of the septum) is usually formed from the skin of the upper lip. When only a part of the nose, as one side only, or the forehead with the base, have been lost, modifications of the above operation are required, and the skin, instead of being taken from the forehead, is taken from the cheek or the upper lip. This operation is called the *Indian Method*, having been introduced from the East and first successfully performed in Europe by Carpus in 1814. It has almost entirely superseded the *Talicotic operation*, first performed by Tagliacozzi or Talicottius (1546–90), professor of Anatomy and Surgery at Bologna, and described in his famous work De Curtorum Chirurgia per Insectionem (1587). He took the skin from the new nose from the arm of a patient; and there is no reason why the operation which he describes, although inferior in many respects to that at present adopted, should not be successful. The difficulty and irksomeness of keeping the arm temporarily long in the exposed state of the surface (a period of about twenty days) is the chief objection to his method. For further details, see Holme’s *System of Surgery*, or Ehrichsen’s, or any other surgical manual.

**Rhinanthæe**, one of the five classes into which Lindley divides the vegetable kingdom. There are three natural classes comprising: 1. grasses, or claviz, Balanophoraceæ, Cyttineæaceæ, and Rafflesieæaceæ, but they have been placed widely apart in the botanical systems of other botanists. The species comprising them agree only in being destitute of true leaves, in having short amorphous stems or none, and in being parasitical on roots. The structure of the flowers, which are in some instances very large,
RHIZOCARPS

The birth of the Balanophoraceae, a most interesting plant, the Fusus Melitensis of apothecaries, long celebrated for arresting hemmorhages. Others likewise are used as styptics. Cynotus hypocratis (Gr. rhizon, a 'root,' and podo, 'feet'), a division of the Protozoa, in the members of which the living matter of the cell flows out in changeable processes as 'pseudopodia.' In other words, the rhizopods are Protozoa in which the axes of the cell-life have become differentiated. The division includes several classes, of which the most important are the Lobosa, with the Amoeba as type, the Heliozoa or Sun-animalcules, the Radiolaria, and the Foraminifera. See AMOEBA, FORAMINIFERA, PROTOZOA, RADIOLARIA.

Rhizocarps. See Salyvia.

Rhizome. See Root.

Rhizo'poda (Gr. rhizon, 'a root,' and poda, 'feet'), a division of the Protozoa, in the members of which the living matter of the cell flows out in changeable processes as 'pseudopodia.' In other words, the rhizopods are Protozoa in which the axes of the cell-life have become differentiated. The division includes several classes, of which the most important are the Lobosa, with the Amoeba as type, the Heliozoa or Sun-animalcules, the Radiolaria, and the Foraminifera. See AMOEBA, FORAMINIFERA, PROTOZOA, RADIOLARIA.

Rhode Island. The smallest of the United States, and one of the original thirteen states of the Union. The state takes its name from the island of Rhode Island in Narragansett Bay. Its length from north to south is not quite 50 miles, and its width is about 40 miles; land area, 1053 square miles. Rhode Island has thus a land surface but little over 1 square mile for each of the residents. The largest state; but, while it ranks only thirty-fourth among the states and territories in point of population, in density of population (407 per sq. mile) it yields only to the District of Columbia. Its name is referred by some to a supposed resemblance of the island of Rhode Island to Rhodies in the Mediterranean, while by others it is considered to be a corruption of Rootell Engladell ('Red Island'), a name bestowed upon this island by the early Dutch.

There are no mountains in the state, but the surface is considerably diversified. The northern and eastern sections are hilly, and the land slopes toward a level region in the south. The most important elevations are Woonsocket Hill, Mount Hope, Diamond Hill, and Hopkins Hill. The coast along the Atlantic Ocean measures about 45 miles, but Narragansett Bay, which penetrates inland some 30 miles, affords with its various inlets about 350 miles of shore washed by tide water. The southern coast west of Point Judith is low and sandy, with numerous fine beaches, and many marshes and ponds of salt water. To the north the shores are formed by high rocky cliffs interspersed with beaches of sand. Newport, Narragansett Pier, and Watch Hill, on the ocean coast, are among the most famous seaside resorts of the country; and Block Island, about 10 miles SW. of Point Judith, is also a favorite watering place.

The western part of the state is marked geologically by the Archaean formation, which is characteristic of much of New England, but an extensive coal-bearing area of the Carboniferous period stretches under the bay across the eastern part of the state. On the Connecticut side the most extensive coal field of anthracite in the United States, but thus far the coal which has been mined has been of inferior quality. There are deposits of iron ore, and excellent limestones and granite. Traces of the terminal moraine of the glacial period are visible in the state, and in many places the soil is stony or rocky, though in some localities it is moderately fertile. Agriculture, however, except in the way of market-gardening, is by no means a leading occupation.

Rhode Island enjoys a maritime climate, milder and more agreeable than that of the other provinces of New England. The rivers of the state are of little importance for navigation, but are of great value in furnishing water-power, and have played a prominent part in developing the industries of the state. The principal rivers are the Seekonk, navigable to Pawtucket, the Woonasquatucket, the Pawtuxet, and the Pawcatuck.

Newport has one of the finest harbours in the world; and the bay affords an extensive area of safe anchorage, with excellent ports at Bristol, Warren, and Providence. Formerly these places enjoyed a large foreign commerce, which finally disappeared with the war of 1812, and, though a considerable coasting trade is still carried on, commerce from that time ceased to be a prominent industry. It was replaced by manufacturing, which has ever since been the characteristic occupation of the people. The cotton-manufacturing industry of the United States had its birth in Rhode Island. In 1790 Samuel Slater, who had been an apprentice in England, built at Pawtucket, Falls the first cotton-mill of America. He equipped the mill throughout with a complete set of machinery which he constructed from memory, and by the time Rhode Island had ceased to be a commercial state it had already upwards of fifty cotton-mills. Cotton manufacturing, with dyeing, bleaching, and calico-printing, still holds the first place among the industries of the state, followed in importance by the manufacture of linen and woolens. The cotton goods—especially socks, locomotives, and firearms—and of jewellery (see PROVIDENCE), rubber and leather goods, &c.

Rhode Island has five counties and five cities,—Providence and Newport, the state capitals, Pawtucket, Woonsocket, and Central Falls. It sends two members to congress. The common school system, established in 1828, is the highest order; but on account of the number of foreign-born persons attracted to the milling villages, and the difficulty in such communities of securing regular attendance, the school system is less uniform than is the case in the state in general. The northern New England towns suffer from the prevalence of illiteracy. In 1807 there were 50,428 pupils enrolled at the elementary schools, with 1086 teachers; 2909 pupils and 131 teachers in high schools; and 850 students and 76 professors at Brown University (1764), one of the oldest and best colleges of the country.

The Northmen are supposed to have visited Rhode Island in the 10th century; and the 'Old Stone Mill' at Newport (q.v.) has been claimed as their work. The first permanent settlement was made at Providence by Roger Williams in 1636. He and other Annamurian adventurers took land from the Indians, and, as a result of the wise policy displayed toward the natives, Rhode Island suffered less from trouble with the Indians than many of her sister colonies. Rhode Island was the last (1730) of the original thirteen states to ratify the constitution. She took an active part in the Revolution, the war of 1812, and the civil war. Pop. (1730) 17,925; (1800) 97,199; (1880) 276,531; (1890) 345,506; (1900) 429,593.

Rhodes, an island of the Mediterranean belonging to Turkey, formerly an important, wealthy, and powerful state. It is 12 miles off the south-west coast of Asia Minor. It is 49 miles long and 21 broad, and is traversed in the direction of its greatest length—north-east to south-west—by a chain of mountains, which in Mount Artemis (the ancient Athyris) reach a height of 4070 feet. The soil is on the
[Rhode Island.]
whole fertile, and produces wine, oranges, figs, olives, and other fruits. Nevertheless, much land lies waste, and the population is decreasing—34,000 in 1843; 28,000 in 1890, all Greeks except 7000 Turks and 2500 Jews. The harbours are neglected, and the trade is inconsiderable (£140,000 a year).

Sponges are the most valuable article of export. Rhodes was the Dorian Greeks from Argos. Situated between the three ancient continents, a position highly favourable to the development of commercial enterprise, the Rhodians at an early period became very prosperous and affluent. Their three mother cities were Lindus, Ialysus, and Camirus, and they planted numerous colonies not only on the neighbouring shores, but also on the coasts of Italy, Sicily, and Spain. With Cos and Cnidus these three towns formed the Doric Pentapolis, a religious league. The island submitted to the Persians in 490 B.C., but was freed from their yoke by Themistocles after the battle of Salamis; the Athenian supremacy, however, soon took the place of the Persian. Athens and Sparta supported the democratic and the oligarchical parties in the island, respectively, but the democratic (supported by Athens) went on until Rhodes submitted to Alexander of Macedon in 332 B.C.; but after his death the Rhodians revolted again. Then began their most prosperous period; they became the first naval power in the Egyptian, their ships being well built, and always splendidly manned and manoeuvred. As allies of the Romans, they opposed the Macedonians, and later the empire of Syria, especially Antiochus the Great; but on the whole they preserved a steady neutrality. Later still they won greater glory by beating off Mithridates the Great, who laid siege (88 B.C.) to the city. After coquetting with Ptolemy, the Rhodians finally sided with Caesar; but, venturing to oppose Cassius, the city was plundered by him (43 B.C.), and he put all the city except the temple under a fine.

The island was struck a fatal blow at her naval power. Under Vespasian Rhodes was made a Roman province, and continued so, subject to Byzantium after the division of the Roman empire, until it was captured by the Saracens in 623 (or 672); who kept it, however, only five years. Shortly after this, however, began, Rhodes was a convenient stopping-place for the Christian fleets. In 1125 it was plundered by the Venetians; in 1204 a Rhodian chief asserted the independence of the island, but thirty years later he felt compelled to put himself under the sovereignty of Venice. In 1428 the city was surprised by the Genoese, but they were soon turned out by the Byzantines, and so Rhodes came back to the eastern emperor. In 1309, after a three years' siege, the city fell into the hands of the Knights Hospitallers (q.v.); and the Knights made it their headquarters. The Turks besieged them there in 1480, and again in 1522-23; on both occasions there was terrible fighting, the Turkish losses being 25,000 and 90,000 to 100,000 men during the two sieges respectively. The Knights, who had only 1600 soldiers (and 400 were sent off their enemies in 1480, were compelled, in spite of their valour and the skill of their grand-master, De Lisle Adam, to capitulate on honourable terms in 1525; they sailed away to Crete. The island has remained a Turkish possession since 1523. It was girt about by strong walls, surrounded by towers, and was provided with 60 excellent harbours. At the entrance of one of its ports stood the gigantic statue of Helios, the Colossus (q.v.).

The city stood at the northern extremity of the island, on the slopes of a natural amphitheatre, and was built on a regular plan, the unity and harmony of its architecture being due to the circumstance that it was the work of one man, Hippodamos of Miletus, the builder of the Piraeus. It was girt about by strong walls, surrounded by towers, and was provided with 60 excellent harbours. The entrance of one of its ports stood the gigantic statue of Helios, the Colossus (q.v.). Besides this statue, one of the seven wonders of the ancient world, 3000 others, of which 100 were colossal, adorned the city, of which 70 were in A.D.

The city was built on the same scale of architectural splendour after each successive destruction by the earthquakes. The arts were prosecuted with assiduity, the city being remarkable for the number and excellence of its paintings, and the grand master's palace. The cit a stalls viva Is the Aeacoon (q.v.) and the Farnese Bull (at Naples); and intellectual activity manifested itself here long after it had declined in most parts of Greece. Parrhasius and Protogenes are celebrated amongst the painters of Rhodes, Lysippus, Chares, Polydorus, Athenodorus amongst her sculptors, and Cleobulus (one of the seven wise men), Timocreon (the scurrilous poet), Euphrates (the Aristotelian), Pametius (the philosopher), and others amongst her writers. Her school of rationalism was very famous, and the rhodian or serenissin of ancient geographers passed through Rhodes. The island produced also many celebrated athletes. The existing city dates for the most part from the period of the Knights' occupation.

The streets are narrow and winding, the houses solidly built, with flat roofs; but the famous street of the Knights, running down to the harbour, is long and comparatively wide. The principal buildings that survive are the church of St John (now a mosque, but in part destroyed by a gunpowder explosion in 1856), the Knights' hospital, and the grand master's palace. He came back viva Is the Aeacoon (q.v.) and the Farnese Bull (at Naples); and intellectual activity manifested itself here long after it had declined in most parts of Greece. after they had obtained the sovereignty of the sea. The only rule that we know now, although the entire code was adopted by the Romans under Antoninus Pius, is the principle of general average: 'If a cargo be jettisoned to lighten the ship, all cargo good and bad is insured for the benefit of all.' The medieval naval law of the Rhodians was not of Rhodian origin. It consisted of four distinct parts, of very different dates, but mostly of practical value.

Rhodium (syn. Rh, at. wt. 104, sp. gr. 12·1) is one of the metals of the platinum group. It is a white, very hard metal, resembling aluminium rather than silver. It fuses less easily than platinum. It is ductile and malleable when pure and after fusion, and insoluble in all acids; but when alloyed in small quantity with platinum, copper, bismuth, and lead it dissolves with them in aqua regia. It usually forms about one-half per cent. of the ore of platinum, from which it is extracted by a somewhat complicated process. Three oxides, two sulphides, and a chloride of rhodium have been obtained and examined by chemists. The chloride unites with several soluble chlorides to form crystallisable double salts, which are of a rose colour (whence the name rhodium, from the Gr. φόδος, 'a rose'). The metal was discovered in 1803 by Wollaston.

Rhododendron (Gr., 'rose-tree'), a genus of trees and shrubs of the natural order Ericaceae, having ten stamens, a very small calyx, a bell-shaped or somewhat funnel-shaped corolla, and a capsule splitting up through the dissepiments. The buds are small and nearly allied genera, e.g. Azalea (q.v.), are scaly and conical. The species are numerous, they have evergreen leaves, and many of them are of great beauty both in foliage and in flowers. A few small species are natives of continental Europe and of Siberia; but the greater number belong to the temperate parts of North America, and to the mountains of India. R. maximowiczii, so designated when the far larger Indian species were unknown, is common in Britain as an ornamental shrub. It is a large shrub or small tree, which forms impenetrable thickets on many parts of the Alleghanies Mountains, and is conspicuous in appearance when in flower. The leaves are large, oblong, acute, stalked, leathery, dark green and shining above, rusty brown beneath. The flowers are large, in umbellate corymbs, varying in colour from pale carmine to lilac. This species is quite hardy in Britain at an altitude of 10,000 feet. A very similar species, with narrower and more pointed leaves, which are of the same colour on both sides, a native of western Asia, and apparently also of the south of Spain. R. Catawbiense, a native of the southern parts of the Alleghanies, with large purple flowers; R. Canescens, the name of which indicates its origin; and R. arboreum, a native of Nepal, with very dense heads of large scarlet flowers, and leaves 4-6 inches long, attaining in its native country a height of 30 or 40 feet, are also fine species, and will soon grow to considerable height. Many of the extremely numerous varieties now common in our gardens and shrubberies have been produced from them by hybridising or otherwise.—Many splendid species of rhododendron were discovered in the Himalayas, the Khasia Hills, and other mountainous parts of India, by Dr Hooker and others, and many of them have been introduced into cultivation. In Europe, R. Falconeri is described as in foliage the most superb of all, the leaves being 18 or 19 inches long. It is a tree 30-50 feet high, with leaves only at the extremities of the branches. It grows in eastern Nepal at an altitude of 10,000 feet; R. subifolium has flowers 4½ inches long, and equally broad, clustered, and very beautiful. R. Maddeni, R. Aucklandii, R. Edgeworthii, and others have white flowers. R. Duthoitianum is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from three to six white lemon-scented bells, 4½ inches long, at the end of each branch. R. Nuttallii has fragrant white flowers, said to be larger than those of any other rhododendron. All these belong to the Himalayas. In more southern latitudes, as on the Neillgherry Hills and on the mountains of Ceylon, R. nobile prevails, a timber-tree 60 to 70 feet high, every branch covered with a blaze of crimson flowers. R. Keyseri and R. Thibaudianum, also natives of the north of India, have flowers with nearly tubular corolla. R. ferrugineum and R. hirsutum are small species, shrubs from 1 to 3 feet in height, natives of the Alps, and among the finest ornaments of alpine scenery. They are called Alpenrose (Alpine Rose) by the Germans. They have small carmine-coloured flowers in umbellate clusters. The mountain-slopes glow with their blossoms in July and August. The flora of the Himalayas contains a number of similar small species. R. anthropogon and R. setosum, dwarf shrubs with strongly-scented leaves, clothe the mountains in eastern Nepal, at an elevation of 12,000 feet and upwards, with a green mantle, brilliant with flowers in summer. R. nivea is the most alpine of woody plants, spreading its small woody branches close to the ground at an elevation of 17,000 feet in Sikkim. R. lapponicum, a profligate shrub, with small flowers, grows as far north as human settlements have reached in Europe, Asia, and America. Some of the species of this genus possess narcotic properties. An oil obtained from the buds of R. ferrugineum and R. hirsutum is used by the inhabitants of the Alps, under the name Otto di Marmotta, as a remedy for pains in the joints, gout, and stone. R. chrysanthum, a low shrub, with golden yellow flowers, a native of Siberia, is also used in gout and rheumatism. R. einaubariinum, a Himalayan species, poisons goats which feed upon it, and when used for fuel causes inflammation of the face and eyes. But the flowers of R. arboreum are eaten in India, and Europeans make a palatable jelly of them.

Rhodope, the ancient name of a mountain-chain (7,774 feet) extending along the borders of Macedonia and Thrace. The Turks call it Despod Yahusi, the Bulgarians Despotku Dagh, both titles having reference to the numerous (Greek) monasteries that stud its sides. Of these the most famous is the vast fortress-monastery of Rilo, in the north-west of the range, standing on its southern side in the midst of magnificent pine
forests. Rhubarb has for generations been the focus of the national Bulgarian church and the mainstay of Bulgarian nationality. See *Fortnightly Review* (April 1891).

**Rhonda Valley**, in Glamorganshire, South Wales, is noted as a centre of coal-mining and for its fine scenery. The railway connecting the whole valley directly with Swansea through the tunnel of Blaengwytte was opened in 1890.

**Rhône** (Lat. Rhodanus), the only important French river which falls into the Mediterranean, takes its rise in the Swiss Alps, on the west side of Mount St Gothard, at an altitude of 5752 feet, and not far from the sources of the Rhine. Its entire length, from its source to its mouth in the Gulf of Lyons, is 304 miles, and the area of its river-basin 38,170 sq. m. It first runs in a south-westerly direction through the canton of Valais, along a narrow valley between the Bernese and the Pennine divisions of the Alps, until near Martigny it takes a sudden turn to the north and pours its waters into the Lake of Geneva (q.v.). It issues from the lake at its southern extremity, proceeding west, and then forces a passage through the Jura. The municipality of Geneva has taken advantage of the strong and steady current of the river where, passing through the city, it is divided by an island into two arms, to utilise it for industrial purposes. A system of 20 horse-power has been constructed in a building in the bed of one of the arms, at a cost of £235,000; and by this means, in 1890, 220 motors with some 1600 horse-power were at work. Formerly the river used to disappear for some distance near Port ELéctra into the subterranean channel La Porte du Rhône; but the vault or covering of the gorge into which it plunged has now been blown away by blasting agents. At St Génis the Rhone turns back suddenly to the north-west, and then once more flows westwards through a more level country as far as Lyons, where it is joined by its largest tributary, the Saône (253 miles long), from the north. From Lyons it follows a southern direction past Vienne, Valence, Montélimart, Avignon, and Arles, where begins its delta, embraced between two main arms, the Greater and the Lesser Rhone. Its most important affluents are, on the right, the Ain, Saône, Ardeche, and Gard; on the left, the Arve, Isère, Drôme, and Durance. From Lyons southward the Rhone is easily navigable for good-sized vessels; but the up-navigation, owing to the rapidity of the current and the sudden shifting of sandbanks, is attended with considerable difficulty, and is at times almost impracticable. On account of these and other obstructions, which are greatest near the mouths of the river, communication with the Mediterranean is in great part dependent upon canals. Canals likewise connect the Rhone with the Rhine by the Saône, with the Seine, the Loire, and the Garonne.

**Rhône**, a department of France, part of the former Lyonnais, has an area of 1077 sq. m. and a pop. (1891) of 900,737 (741,470 in 1881). It lies almost wholly in the basin of the Rhone and the Saône, its eastern boundary being formed by these rivers. The surface is almost entirely hilly, being broken up in all directions by low spurs of the Cevennes. Corn, potatoes, wine, and fruits are the principal products. Nearly one-half the area is cultivated in wheat, one-eighth in vineyards, one-ninth under forest, and nearly one-sixth meadows. Some 13 million gallons of wine are made annually. The department is industrially one of the most important in France; all the branches are carried on at Lyons (q.v.), a city of the department, Armentières, Lyons and Villefranche. See also BOUCHEs-DU-RHôNE.

**Rhubarb** (Low Lat. rheubarbarum, from Gr. rhoeion barbactor, literally 'the plant which penetrates', so called because it was formerly thought to have a rhoeion, or radish, in its root; but this is not definitively known what species of rhubarb yields the valued rhubarb of commerce, which comes from inland parts of China or Chinese Tartary. The bulk of it reaches Europe now direct from China, but the best, in limited quantities, is brought through Russia. It is commonly known in Britain as Turkey Rhubarb, because it was formerly brought by way of Asiatic Turkey.

The leaf-stalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are much used, like apples, for tarts and various kinds of preserves. A kind of wine may also be made of it. For these purposes different kinds of rhubarb and now very extensively cultivated in Britain, and in other temperate and cold countries. A number of species have been introduced into cultivation for their leaf-stalks. The cultivated kinds, *R. undulatum*, *R. rhaponticum*, and *R. hybridum*, with endless varieties produced by the art of the gardener, all have broad, heart-shaped, undivided leaves, and the leaf-stalks flattened and grooved on the upper side. The leaf-stalks are often also of a reddish colour, which in some of the finest varieties pervades their whole flesh. Rhubarb is cultivated on a most extensive scale by market-gardeners. It is forced in winter and early spring by being placed in pots within houses, or by having pots inverted over it, and dung and straw heaped around; and forced rhubarb is more tender and delicate than that which grows in open air. The stalks when blanched are much less harsh in taste and require less sugar to be rendered palatable. It is largely grown also in many parts of the United States.
The well-known medicinal R. officinale differs considerably in appearance from what is found in the wild. The petals are nearly round, and the under side of the leaf is covered with small, erect hairs. The numerous varieties of commercial rhubarb may be thrown into two groups: (1) Asiatic Rhubarb—Chinese, passing under the names Russian, Muscovy, Turkish, Canton, or East Indian, Batavian or Dutch rhubarb, yielded, probably by R. officinale and a variety of R. palmatum; Siberian, by R. rhaponticum; Himalayan large, by R. emodi, and small by R. webbiamum; Bokharan or Bokharian. The European, or proper species, R. Rhasb. English, by R. rhaponticum and R. officinale; French, by R. rhaponticum, compactum, and undulatum; Austrian (Moravian), by R. rhaponticum. R. palmatum is believed to produce some of the best Russian rhubarb. Whether R. officinale occurs in Shan-lai and Szechwan, from which provinces the true rhubarb is chiefly obtained and sent to Hankow, is not definitely known. The export of rhubarb from China (the so-called Turkey Rhubarb) has largely increased of late years. The average shipments of the four years ending with May 1890 is 32,000 lb., and the average prices range from 3. 4d. to 5s. 6d. per lb. It is lighter and less active than the imported rhubarb, and has been often pronounced worthless; but, according to Dr Watt, this is owing to the fact that an inferior variety reaches the plains. The whole sour stems are eaten both stewed and raw, while the leaves of this and other species are dried and smoked in Tibet and in the Eastern Himalayas.

Rhubarb is not individually mentioned now in the official trade returns, but is included with "unnamed drugs." Since 1870, when the imports were 1,135 lb., and the average prices ranged from 3s. 4d. to 5. 6d. per lb., the supplies have increased and prices have fallen by one-half. The production of English grown rhubarb root now amounts to about 12,000 lb. annually, of which from three to four thousand pounds are exported.

Chemically, rhubarb consists of mastic, oxalate of lime, an albuminoid containing nitrogen and sulphur, crystalline resins, tannin, gallic acid, sugar, chrysophane (decomposable into chrysophanic acid and glucose), rheotannic acid, and emodin.

Rhubarb may be briefly described as a cathartic, an astringent, and an antidiarrhoeal. It is chiefly used in the treatment of many infantile diseases attended with imperfect digestion and irritation of the intestinal canal. In adults it is serviceable in chronic diarrhoea and dysentery, when it is expedient to thin out the juice. It is also a useful aperient in convalescence from exhausting disease, as being free from the risk of overacting; and, for the same reason, it is a useful medicine for persons who are constitutionally liable to over-purgation from trivial causes.

Rhuddlan, a decayed town of Flintshire, North Wales, on the Chwyd, 3 miles S.S.W. of Rhyl. It was formerly a castle, built 1091, and dismantled after its capture by the Roundheads in 1646, was the scene of the betrayal of Richard II. by Percy (1399); at the march of Morda Rhuddlan, across the river, Offa defeated Caradoc (795). With Flint, &c., Rhuddlan returns a member to parliament. Pop. 1242.

Rhus. See Sumach.
RHYL, a watering-place of Flintshire, North Wales, at the mouth of the R. Clwyd, 6029.

A mere fishing-village so late as 1830, it has fine sands, a promenade pier 705 yards long, built in 1867 at a cost of £17,000, an esplanade, an aquarium and winter garden, a dozen hotels, bathing places, &c.; and, though the country around is flat, it contains the old town of Rhuddlan.

Pop. (1851) 1563; (1851) 6029; (1851) 6491.

Rhyne, or, more properly, Rime (the former spelling being merely due to a confusion with the Greek rhythm), is itself a native Tentonic word; A.S. rim, leol, rimne, Ger. reim, and O.H. Ger. rim (which itself is like rim with the special accent of Gr. ῥήμα), or the English rime, and the English rime (the latter is a mere form of the word in other northern tongues as well as in the Romanic) meant simply a poem, a numbered or versified piece (compare Lat. numeri, numbers, versus, stanzæ); but it has now come to signify that which is the most prominent mark of versification in all these tongues—viz. the recurrence of similar sounds at certain intervals. As there may be various degrees and kinds of resemblance between two syllables, there are different kinds of rime. When words belonging to the same consonant have Alliteration (q.v.), which was the prevalent form of rime in the earlier Tentonic poetry, as in Anglo-Saxon. In Spanish and Portuguese we find employed a peculiar kind of rime called Assonance, consisting in the coincidence of the vowels of the corresponding syllables, without regard to the consonants; this accords well with the character of these languages, which abound in full-toned vowels, but is ineffective in English and other languages in which consonants predominate. In the Middle English and Modern English, the French, the Italian and the Greek, the vowels of the corresponding syllables are not used for the purpose. In English there is chiefly the use of the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

And then to see how ye 're neglect'd,
How hee'd, and cry'd, and disrepeck'd.

When two successive lines rime they form a complete; three form a triplet. Often the lines rime alternately or at greater intervals, forming groups of four (quadraune) or more. A group of lines containing all the varieties of metre and combinations of rime that occur in the piece forms a section called a stave, sometimes a stanza, often, but improperly, a verse. In the days of elaborate Acrostics (q.v.), verses constructed in shapes, and other conceptions of the French, the French, the Italian and the Greek, the vowels of the corresponding syllables are not used for the purpose. In English there is chiefly the use of the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

The advantages of rime," says Guest, "have been felt so strongly that no people have ever adopted an accentual rhythm without also adopting rime. The Greek and Latin metres of the classic period, depending upon time or quantity, and not upon accent, were able to dispense with the necessary of rime; but, as has been well observed by French (Introduction to Sacred Latin Poetry), even 'the prosodic poetry of Greece and Rome was equally obliged to mark this (the division into syllabics or stresses) for the sake of the stanzæ and lines, in a different manner. Thus, adactyl and spondees were allowed to be promiscuously used throughout the hexameter line, no satisfying token would have reached the ear to indicate the close of the verse; and if the hearer had been left in doubt as to the close of the line it would have been almost impossible for him to recover it. But the fixed dactyl and spondee at the end of the line answer the same purpose of strongly marking the close as does the rime in the accentuated verse; and in other metres, in like manner, licences permitted in the beginning of the line are excluded at its close, the
motives for this greater strictness being the same.' It is chiefly, perhaps, from failing to satisfy this necessary condition that modern unrhymed verse is found unsatisfactory, at least for popular poetry; and it may be doubted whether it is not owing to the classical prejudices of scholars that our common English blank verse got or maintained the hold it has.

The objection that rhyme was 'the invention of a barbarian nation to set off wretched matter and lame metre,' rests mainly on ignorance of its real history. It cannot be considered as the exclusive invention of any particular people or age. It is something human, and universal as poetry or music—the result of the instinctive craving for well-marked recurrence and sound. The oldest poems of the Chinese, Indians, and Arabs are rhymed; so are those of the Irish and Welsh. In the few fragments of the earliest Latin poetry that are extant, in which the metre was of an accentual, not quantitative kind, there is a manifest tendency to terms of similar sound. This native tendency was overrided for a time by the importation from Greece of the quantitative metres; yet even under the dominance of this exotic system rhyming verses were not altogether unknown; Ovid especially shows a liking for them:

Quot column stallas, tot habet Rex Roma puella;

and in the decline of classicality they become more common. At last, when learning began to decay under the invasions of the northern nations, and a knowledge of the quantity of words—a thing in a great degree the basis of metre, and requiring to be learned—to be lost, the native and more natural property of accent gradually reappeared as the ruling principle of Latin rhythm, and along with it the tendency to rhyme. It was in this new vehicle that the earlier insight sought to convey their new ideas and aspirations. The rhymes were at first often rude, and not sustained throughout, as if lighted upon by chance. Distinct traces of the adoption of rhyme are to be seen as early as the hymns of Hecyra (died 368), and the system attained its greatest perfection in the 12th and 13th centuries. In refutation of the common opinion that the Latin hymnologists of the middle ages borrowed the art of rhyme from the Teutonic nations, Dr Guest brings the conclusive fact that no poem exists written in a Teutonic dialect with final rhyme before Offa's death was followed by Frankish about 870. Alliteration had previously been the guiding principle of Teutonic rhythms; but after a struggle, longer protracted in England than on the Continent, it was superseded by end-rimes.

See the articles Alliteration, Blank Verse, Hexameter, Measure, Ode, Poetry, and Sonnet; also Guest's History of English Rhymes (ed. by Professor Skeat, 1882), where the whole subject is learnedly and elaborately treated; Trench's Sacred Latin Poetry (1864); F. Wolf, Lateinische, und französiche Schiller (1814): and Schipper's Enghche Metrik (Bon, 1881-89).

Rhymer. See Thomas the Rhymer.

Rhyney, a town of Monmouthshire, on the river Rhyney (running to the Bristol Channel near Cardiff), 24 miles W. of Tredegar. It is the seat of ironworks. Pop. (1861) 7630; (1891) 7738.

Rhynechella. See Brachyopoda.

Rhyncophora. See Weevil.

Rhynehops. See Skimmer.

Rhyolite. See Lepidote.

Rhy, John, was born near Ponterwyd in Cardiganshire, June 21, 1840, served a paril- feeship under a Welsh bishop, was at Bangor Normal College kept a school in Anglesey down to the end of 1865, when he entered Jesus College, Oxford. He was elected to a fellow-ship at Merton in 1869, and next continued his studies at the Sorbonne, Heidelberg, Leipzig, and Göttingen, returning in 1871 to become inspector of schools for Flint and Denbigh. In 1872 he was appointed professor of Celtic in the University of Oxford, and in 1881 was elected a fellow, and in 1893 principal of Jesus College. His Lectures on Welsh Philology (1877) and Celtic Britain (1882) confirmed a reputation already gained. In 1890 Kuhn's Beiträge zur vergl. Sprachforschung, the Rete Celtique, and the Archæologica Cambrensis. He gave the Hibbert Lectures on Celtic Heathendom in 1886, and at the close of 1889 the Rhiadn Lectures at Edinburgh. Professor Rhyys is a contributor to the present work.

Rhythm may be defined as measured or timed recurrence of sounds, in order that a number of parts may constitute a pleasing whole, a certain relation or proportion must be felt to pervade them, and this exemplified in the arrangement of matter into visible objects, as in sculpture, architecture, and other plastic arts, produces a rhythm which is usually called symmetry. Rhythm applied to the movements of the body produces the dance. 'The rhythmic arrangement of sounds not articulated produces music, while from the like arrangement of articulate sounds we get the cadences of prose, and the measures of verse.' The rhythm and verse may be hence considered as a succession of articulate sounds, regulated by a rhythm so definite that we can readily foresee the results which follow from its application. Rhythm is also met with in prose; but in the latter its range is so wide that we never can anticipate its flow, while the pleasure we derive from verse is founded on this very anticipation.'

The rhythm of verse is marked in various ways. In Greek and Latin, during their classic periods, quantity, or the regulated succession of long and short syllables, was the distinguishing mark of verse. In the languages developing from these the rhythm depends upon accent. The recurrence of similar sounds, or rime, is also used, along with accent, to render certain points of the rhythm more distinct, as well as to embellish it. See Metre, Rhyme.

Rhytina, a genus of Sirenia, akin to the dugong and manatee, of which only one species is known—the Rhytina stelleri, discovered by Belcher and the naturalist Steller when they were wrecked on Behring Island in 1741, and described very fully by Steller. At that date they were extremely plentiful in this part of the northern Pacific, but were soon almost exterminated, the Russian hunters and traders. Nordenskiöld's inquiries led him to believe that individuals were seen till the middle of the 19th century. The species was distinguished by its large size, sluggishness, and its having horny plates in place of teeth. The skin was rough and hairy. The Vega expedition brought home many skeletons.

Riad. See Wahabis.

Riazan, a town of Russia, and capital of a govern- ment, stands near the right bank of the Oka, 115 miles by rail SE. of Moscow. A straggling, ill-built town of wooden houses, it sends wheat to Moscow. Pop. 30,107.

Ribalta, Francisco (1550-1625), and Juan (1597-1628), painters of the school of Valencia.

Ribble. See Preston.

Ribbon, Riband, or Ribband (a Celtic word). The principal ribbon manufacturing centre in Cov- entry is in the district containing Coventry and Belleile abroad, as also, more recently, the middle Rhine. Ribbons were also formerly made in Derby and Leek. In Coventry the ribbon industry was commenced
by Bird at the beginning of the 18th century. Coventry was at that time a city of 12,817 inhabitants. The population increased with the progress of the ribbon industry, and in 1809 it was 41,698. In 1890 there were 58,866 looms; but in 1893 not one-third of this number was employed, and the number is much less now. In 1861 there were 40,600 people dependent upon the ribbon trade, in 1881 not more than a fourth. The ruin and migration of the Cranberry industry from the causes—first, strikes, particularly the great one of 1869; second, the French treaty of 1860, before which this branch was protected by a duty of 15 to 30 per cent. The great competition of Basel and St Étienne then soon ruined the production of Coventry. To this could be added, the lower price, the finer quality, the cheaper, the hours of work longer, and taste and style superior, particularly at St Étienne. Crefeld, Moscow, and especially Paterson in New Jersey, are also manufacturing centres. Amongst the various kinds of ribbons woven in Coventry are the following: Taffeta, gros-grain, twill, satin, satinet, ottoman-satin, and terry, plush, brocade, faille, plaids, watered satins, birthday ribbons, and book-markers, sauretats, orientals, waistbands, and other plain and figured narrow fabrics. Of the narrow kind the principal is the gros-grain, gros-grain is a ribbed silk; plush, a variety of pile surface; satin, a smooth polished surface, &c.; and there are mixtures of these various fabrics, generally woven in stripes, faille with satin, satin with terry, velvets with satin, plain and figured in conjunction, making an infinite variety of decorative effects both in weaving and colour.

The construction of the fabric of a ribbon is like that of broad silks viz. the threads or warp (Fr. chaîne) lengthwise; those at right angles, or shot across the warp are called the weft (Fr. traverse). The warp consists of many threads, the whole of which interweaves the warp of one, or at most a few only, according to the number of colours or style of fabric required. There are two kinds of looms or methods of weaving, hand-loom and power-loom, the latter having gradually but surely superseded the former, except for very artistic work. These two looms have also of two kinds, those which weave plain goods and those which weave figured or patterned work. The latter are called Jaquard looms (see Weaving); in these every warp-thread is so isolated as to be under mechanical control, and each, independently of every other thread. These warp-threads are raised by means of the ‘harness’ to allow of the shuttle to pass between the whole or parts of the warp-threads according to the pattern or style required. The harness is composed of ‘leashes,’ the purpose of which is to raise at will the warp-threads, each of which requires one leash. The term ‘shel’ is applied to the warp when separated horizontally by the harness for the shuttle to pass between; this is called the ‘opening,’ that in the upper surface being termed the top shed, and the lower part the bottom shed. The shuttle contains the quill in which has been wound the ‘filling,’ which is a portion of the shuttle or weft-thread, and is propelled in the shuttle between the warp-threads by hand or by other power, generally steam-power. In front of the opening there is often the ‘slay’ or ‘reed,’ which is a comb-like apparatus through which the warp-threads pass before they receive the shuttle into its resting-place in the fabric. The Jaquard arrangement is placed on the top of the loom, which indicates the position of the requisite machinery to work them. See Silk.

Ribbon-fish, a name given to several genera of Acanthopterous fishes having the body much compressed and band-like, the dorsal fin extending the whole length of the back, the anterior rays being long and distinct, the skeleton soft, and the skin naked and silvery. They are true deep-sea fishes, and are widely distributed, though nowhere abundant. Some authorities divide them into two groups—the Trachypteridae, having long ventral fins, and the Regaleonidae, with short ventral fins represented by single, oar-like filaments. The best-known species is Regaleon banksi, the Dealfish (q.v.).

Ribbonism, the name assumed by a group of secret associations among the lower classes in Ireland throughout the half century extending from 1820 to 1870, at its greatest height from about 1855 to 1855. It began in 1825, and it was sandwiched among several others that were wrapped in obscurity, but it appears in the beginning at least to have been political in its aims, and O’Connell’s opinion seems most probable, that it grew out of the northern Defenders who banded themselves together as the Orange organisation. Earlier associations with somewhat similar objects were the Whiteboys and the Threshers, and, in particular corners of the island, the Carders, Shanavasses, and Caravats.

Ribbonism, according to O’Connell, was more political in its aims, inasmuch as the organisation of the Orange lodges; in the south it was rather into what he characterised as ‘driftless acts of outrage.’ Although everywhere condemned by the Catholic clergy, it included none but Catholics within its numbers, and it maintained its influence by a system of oath-taking and secrecy, and so on.

Of these many were made known to the authorities by informers, but they were found to contradict completely rather than merely differ from each other. One striking feature of Ribbonism, as distinguished from most Irish patriotic associations, was the fact that its adherents belonged exclusively to the very lowest and most ignorant classes, the humbler peasantry, farm-servants, labourers, and petty shopkeepers, hardly even the smallest farmers or their sons apparently belonging to it in any part of Ireland. So far as there was any unity in its aims, it aimed at making itself a political force in all agrarian questions; but, as A. M. Sullivan pointed out, the Ribbonism of one period and of one district was not the Ribbonism of another. In Ulster it professed to be a defensive or restorative organisation against the actions of the Orange Lodges. In Munster it was at first a combination against tithe-proctors. In Connaught it was an organisation against rack-renting and evictions. In Leinster it often was mere trade-unionism, dictating by its mandates or threatening by its vengeance the employment or dismissal of workmen, stewards, and even domestics. This latter phase generally preceded the disappearance of the system in a particular locality, and was evidently the lowest and basest form to which it sank or reverted.

The name, which of course originated in a green badge worn by the members, does not appear to have been attached to it till about 1826; and its influence seems to have grown gradually till about 1830, from which time it began rapidly to decline before a body of official and non-official lukewarm political intelligence that recognised the greater advantage of more open and legitimate agitation. Here and there traces of a demoralised Ribbonism survived, capable of an occasional outbreak into a malignant crime, but its declaration as illegal by the Westminster Act of 1871 was hardly better than a mere fogging of the bowels of the state.

See W. Stewart Trench, Realities of Irish Life (1868), and A. M. Sullivan, New Ireland (1877).

Ribéauville (Ger. Rappoltsweiler), a town of Upper Alsace, pleasantly situated amid vineyards at the mouth of the Voges, 33 miles SSW. of
Strasburg. Excellent wines are made; cotton and calico goods are manufactured, and there are numerous flour, oil, and saw mills. Pop. 59,002.

Ribera, JUSEPE, called SPAGNOLETTO ('Little Spaniard'), was born at Jativa, near Valencia, on 12th January 1588, and died at Naples in 1656. He studied a few years with Francisco Ribilta at Valencia, then crossed the sea and continued his studies in Rome, Parma, and Modena. He settled in Naples, where he adopted the boldness of Caravaggio's style, and became the ablest painter among the naturalists. His treatment of subjects was based on a vigorous, but generally coarse, representation of nature, in opposition to that formed on the study of conventional or academic rules. He attracted the attention of the viceroy, became court-painter, and was elected member of the Academy of St Luke in Rome in 1630. His realism is forcible and generally gloomy: he delighted to represent horrible and gruesome subjects, such as the martyrdoms of SS. Bartholomew, Januarius, and Lawrence, 'Prometheus,' &c. Salvador Rosa and Giordano were his most distinguished pupils. He executed several etchings marked by force and freedom.

Ribes (from Arab. riba), a genus of shrubs belonging to the natural order Ribesiacceae, familiar examples of which are the Gooseberry and the Cur- rant of gardens. The species are chiefly natives of the temperate and colder regions of the northern hemisphere; some are found at high elevations in tropical America and on the Pacific coast, from California to Chili. They are found also on the mountains of Northern India, in the colder regions of Africa and Europe, but western America is the home of the largest number of the species. They are twining shrubs, often, as in the Gooseberry (R. grossularia and R. speciosa), armed with spines, clothed with deciduous alternate leaves, usually palumbly lobed. The flowers are axillary in racemes, rarely solitary—small but often showy in the mass, as in R. speciosa and R. sunguineum, the former a native of California, often to be met with trained to walls in British gardens; the latter, enjoying a wide range in the northern United States, is also a very popular shrub in British gardens, well known under the name Scarlet or Flowering Currant. The calyx is the most conspicuous organ of the flower. It is persistent or adhering after it has shed its stamens, a feature very familiar in the gooseberry. The fruit is a berry, not in all species succulent, as in the gooseberry, currant, and others, but sometimes, as in R. sunguineum, almost entirely pulpless when ripe.

The most important product of the genus is the fruit, which consists of sweet mulglage mixed with malic and nitric acid along with an astrignonent substance. The gooseberry, the Red Currant (R. rubrum), and the Black Currant (R. nigra) are natives of Britain—that is, they find a place in the British flora, though there are authorities who doubt whether they are truly indigenous, being rather disposed to think that where they are found wild they are merely escapes from cultivation. They have, however, been cultivated in British gardens for centuries, and the fact that they attain to higher perfection as fruits in Britain than in any other country—their excellence—has been noticed in the British provinces and Spain, although the plant is well known, the fruit is always inferior owing to the greater warmth of the climate—is strongly in favour of the presumption that the plants are indigenous to Britain (see CURRANT, GROSSULARIACEAE). The fruit of R. grossularia is a drupe, and the several berries of others, natives of North America, are pleasant to eat and have similar properties to those ascribed to the gooseberry and currants.

Rib-grass. See Plantain.

Ribbs are elastic arches of bone, which, with the vertebral column behind, and the sternum or breast-bone in front, constitute the osseous part of the walls of the chest. In man there are twelve ribs on each side. The first seven are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed vertebro-ster nal or true ribs; while the other five are known as false ribs, and the last two of these, from being quite free at their anterior extremities, are termed floating ribs. A glance at a skeleton, or at a plate representing the articulated bones, will show that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior; this obliquity increasing to the ninth rib, and then slightly decreasing. They increase in length from the first to the eighth, and then again diminish. The spaces between the ribs are termed the intercostal spaces. On examining a rib taken from about the middle of the series we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facet being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebrae, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercle, from whence the shaft commences. On the lower and inner part of this tubercle is a small oval surface, which articulates (as shown in fig. 2) with a corresponding surface on the upper part of the transverse process of the lower of the two vertebrae with which the head is connected. The shaft presents an external convex and an internal concave surface. A little external to the tubercle the rib is bent to form the angle, from
which point the rib passes forwards and outwards, ultimately curving inwards to join its costal cartilage. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of Mammals are mostly connected, as in man, with the bodies of two vertebrae, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea the posterior ribs hang down from the transverse processes alone. Their number on each side corresponds with that of the dorsal vertebrae. The greatest number, twenty-three, occurs in the two-toed sloth, while in the Cheiroptera eleven is the ordinary number. In Birds each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a ‘diverging appendage,’ which projects backwards over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebrae here never exceed eleven, and are commonly seven or eight in number, and the ribs proceeding from them are connected with the sternum not by cartilage, as in mammals, but by true ossous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the Chelonia Reptiles the ribs (as well as the vertebra and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of anchylosed ribs united by dermal plates. In the Crocodiles there are only twelve pair of true or dorsal ribs; while in the other Saurians, and in the Ophidians, the ribs are usually very numerous. In the Frogs there are no true ribs, the reason probably being that any bony element in their thoracic walls would interfere with the enormous thoraco-abdominal enlargement which these animals periodically undergo at the breeding period.

In the language of the comparative anatomist, a rib is to be regarded as a Pleurapophysis—one of the elements of a typical Vertebrum (q.v.).

Fracture of the Ribs is a very common surgical accident, resulting from blows or falls upon the chest. Ribs may, moreover, be broken by mere pressure, as when persons are severely crushed in a crowd; and instances are on record in which, in the case of aged persons, the ribs have been actually fractured in violent coughing. The treatment consists in the application of a broad flannel roller round the chest, so tightly as to prevent, as far as possible, all movement of the ribs, and to render the respiration abdominal rather than thoracic. The handiage must be prevented from falling in and in order to prevent the shoulder-blade from moving, and thus disturbing the broken ribs, some surgeons confine the arms to the side of the body. If one or both of the extremities of the fractured rib should perforate both layers of the pleura and wound the lung, or in rare cases when only the parietal layer of the pleura is injured, if the skin is also perforated, air may escape in the act of inspiration from the lung or from the exterior into the pleural cavity, and thence through the wound in the costal pleura into the cellular or areolar cavity of the trunk, giving rise to Empysema (q.v.), in the form of a soft puffy swelling that crepitates and yields under pressure.

Ricardo, David, an eminent political economist, was born in London, 19th April 1772. His father was a Jew, a member of the Stock Exchange, and brought up his son to the same business. An alienation took place between them, when in 1793 young Ricardo married out of the Jewish persuasion and conformed to the Christian religion. He continued, however, to follow his father's profession with such success that at a very early age he realised a large fortune, while preserving an honorable reputation throughout his career in business.

In 1790 Ricardo had his interest in political economy awakened by the perusal of Smith's Wealth of Nations. His experience, as his biographer tells us, fitted him for the treatment of the special class of economic questions connected with banking and finance, and it was in the discussion of them that he first made his mark. In 1808 he brought out a pamphlet entitled The High Price of Bullion a Proof of the Decompensation of Banknotes. From the indications of the banknotes, it was an argument in favour of a metallic basis. Other successful pamphlets followed. In 1817 appeared the work on which his reputation as an economist chiefly rests, On the Principles of Political Economy and Taxation. It is not a complete treatise on political economy, but may be described as a discussion of some of the principal factors of the science, such as value, wages, rent, &c. Ricardo is the conspicuous example of the abstract method of political economy. He was very deficient in the philosophic and historical training necessary for the wider investigation of economics. He approached the subject as a member of the Stock Exchange; and the economic conditions which he contemplated were those prevalent in his own day in England and in countries similar to it, namely, that of a great city. The main gist of his work is to embody economic principles in formulas, which for the most part have a general validity relative to the limited conditions which he thus assumed. His theories of Rent (q.v.) and of Wages (q.v.) have a general truth when regarded in this way; but when considered from a wider historical and philosophic standpoint they shrink greatly in significance. His theory of Value (q.v.) is still more defective.

In 1819 Ricardo entered parliament as member for Portarlington, and retained his seat till his death at Gatecomb Park, Gloucestershire, on 11th September 1823. He was too dilluent to be an effective speaker, but his speeches, especially on matters of trade and finance, which he had made
particularly his own, always commanded respect, and had a very considerable influence. Personally he was highly esteemed. His method in political economy is now almost universally abandoned. Even the strongest supporters of the traditionary school of political economy that the formulas have been greatly overrated, and must undergo continual limitation, modification, and correction in the light of experience and of historic conditions. Yet his theories are eminently worthy of study, both as a phase in the development of economic sciences as illustrations in the stage of the development of economic facts. The collected works of Ricardo were edited by M'Culloch (1846), and his Letters to Malthus were published in 1857.

Ricasoli, Baron Bettino, Italian statesman, was born at Florence, 9th March 1809, and studied at Pisa and Florence. He was one of the best agriculturists in Italy, wrote books on the cultivation of the vine, the olive, and the mulberry, and for ten years worked successfully at the drainage of the Tuscan Maremma (q.v.). In 1859 he took a prominent part in opposing the government of the grand-duke of Tuscany (ITALY), and when the latter fled Ricasoli was made dictator of Tuscany. He laboured with great energy for the unity of Italy, and when that end was accomplished was by Victor Emmanuel appointed governor-general of Tuscany. On the death of Cavour (see) in 1861 he took his place at the head of the ministry; but his government was undermined by Rattazzi, and he resigned in March 1862. Ricasoli returned to power in June 1866, but was again obliged to retire in April of the following year. At the same time he withdrew altogether from public life; he died in Rome, 23rd October 1886. Ten volumes of his letters and papers were published in 1886-94. See Life by Gotti (1894).

Ricci, Matteo, founder of the Jesuit missions in China, was born at Macerata, 6th October 1552, studied at Rome, and in 1583 obtained leave to settle at Chow-King. He made his headquarters at Se-eronga, but was ultimately compelled to retreat to Peking, where he built a church. He so mastered Chinese as to write dialogues and other treatises which received much commendation from the Chinese literati, and met with extraordinary success as a missionary. At his death, 11th May 1610, he was universally mourned. See JESUITS, Vol. VI. p. 314.

Ricci, or Rizzo, David. See Mary Queen of Scots.

Rice (Oryza), a genus of grasses, having panicles of one-flowered spikelets, with two very small pointed glumes, the florets compressed, the palea strongly nerved, awned or awnless, six stamens, one germen, and two feathery stigmas. The Greek name oryza, was probably derived from an Arab or Persian word akin to the Sanskrit viriti, a word which passed into Arabic as ariza or ariza, whence the Spanish form arroz. The only important species is the Common Rice (O. sativa), one of the most useful and extensively cultivated of all grains, supplying the principal food of nearly one-third of the human race. It seems to be originally a native of the East Indies, but is now cultivated in all quarters of the globe, and almost wherever the conditions of warmth and moisture are suitable. It is adapted to tropical and subtropical climates, and can be cultivated on former margin; and requires much moisture, rather, however, in the soil than in the air. Rice is an annual, varying from 1 to 6 feet in height. There are many other distinguishing characteristics of the varieties in cultivation, some having long awns and some being awnless, some having the chaff (patina), when ripe, yellow, white, red, black, &c. The seed or grain of rice grows on little separate stalks springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and wheat. It requires a moist soil, sometimes flooded; and the cultivation has in many places been attended with an increase of intermittent fevers and of general ill-healthiness. It is introduced as being artificially flooded at certain seasons. In some parts of the East canals are carried along the sides of hills for the irrigation of land for the cultivation of rice. In South Carolina rice is sown in rows in the bottom of trenches, which are about 16 inches apart; the trenches are filled with water to the depth of several inches, till the seeds germinate; then the water is drawn off, and afterwards the fields are again flooded for rather more than a fortnight to kill weeds. They are flooded again when the grain is near ripening. In Europe the cultivation of rice is most extensively carried on in the plains of Lombardy and in Valence in Spain. Marshy situations, where there is always the same abundance of water, are not so suitable for rice as those in which the supply of water is regulated according to the season and the growth of the plant. The best of all rice known in the market for size and quality is that of Carolina, yet the introduction of rice into the United States took place only about the middle or close of the 17th century; for the date has been disputed, 1694 being the earliest year in which it is known to have been grown. Rice in the buck is called Paddy in India. The wild forms are of the marshy tropical countries of southern Asia, as well as in northern Australia, is without doubt the plant from which all our forms of cultivated rice have been derived. Most modern authors regard India as the first home of rice, though some say it was originally derived from China. It has been cultivated in India from time immemorial. At the Calcutta Exhibition of 1884, 4000 apparently distinct forms of Bengal rice were shown, arising from differences of climate and varieties of soil. There are 1400 different specimens of rice in the Calcutta Museum. There are as many as 1500 names of rice, and though very many of these are merely local synonyms, a large number unquestionably correspond to intrinsic and seasonal distinctions. The obvious differences in the grain itself are indeed very remarkable. In colour the specimens range from a bright golden hue through almost every gradation of tint to black; and in regard to size also they vary greatly. But all these forms of rice are referable to a very few well-marked and constant varieties of O. sativa, the result of seminal variation commonly observed in plants that have been long bred and cultivated. The rice exported from India is divided broadly into three qualities—(1) table rice; (2) ballam, named after the boats in which it is carried; and (3) monkey, common or inferior rice. Cargo rice is that in which only one part in five is hanked. In British India these are more than 60 million acres under rice; in Ceylon,
RICE

605,000 acres; and in Cochin-China, 2 million acres. It is also extensively grown in Siam, China, Japan, Java, Egypt, and Brazil. In 1890 India exported 34,590,000 cwt.; China, 9,500,000 cwt.; Japan, 4,700,000 cwt. The production in the United States has fluctuated much. In 1860 it was 187,140,173 lb.; in 1870, 73,635,071; in 1880, 110,131,173. In 1890, 388,912 lb. were exported, and 113,308,571 lb. were imported. After South Carolina the principal rice-growing states are Georgia and Louisiana. Great Britain imports about 6,000,000 tons annually, mainly from Burma; of this half is re-exported.

In China rice is generally sown very thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants tiller or spread at the root very much, so that each sends up several or many stalks. The rice-grains are carefully kept clear of weeds, although often so wet that a man cannot walk in them without sinking to the knees. In many parts of China and in other countries it is common to obtain two crops of rice in a year.

Rice is husked and quickly dried before being brought to market. Special milling machinery is required for removing the inner skin of the rice grain, and a large quantity of the grain is broken by the process, being used only as broken rice or rice flour. Good Indian rice has the following composition: Moisture, 13.50 per cent.; nitrogenous matter, 7.41; starch, 78.10; fatty or oily matter, 0.40; ash, 0.56. Rice contains a small quantity of niacin and phosphates and other elements. Rice is not used as extensively in the United States as it is in China. Rice flour is used in the manufacture of many food products: bread, crackers, pastas, and desserts.

Rice in the diet of a typical American family today includes rice as a staple food. Rice is a versatile and nutritious grain that can be enjoyed in a variety of dishes, from simple steamed rice to flavorful rice pilafs and risottos. It is a rich source of carbohydrates, which provide energy, and also contains small amounts of protein, fiber, and vitamin B complex. In the United States, rice is produced in several states, with the majority of rice being grown in the southern region. The most common types of rice grown in the United States are long-grain and short-grain rice. Both types are consumed in the United States, with long-grain rice being more common in the southern regions, while short-grain rice is popular in the northern states. Rice is also exported from the United States, with China being one of the largest importers.

RICHARD I.

703

7 to 8 feet high, with broad diffuse leaves, and a large terminal panicle of male flowers, with a spike of female flowers at the summit. The flowers have six stamens. The seeds are about half an inch long, slender, and angular, affording very good meal, and are much used by the Indians where the plant abounds.

Rice, James, novelist, for nine years collaborator with Mr. Walter Besant (q.v.), was born at Northampton in 1843, studied at Cambridge, drifted from law into literature, and became proprietor and editor of Once a Week. He died in London, 25th April 1882.

Rice-bird, a name given to the Bob-o-link (q.v.), as also to a popular cage-bird, the so-called Java Sparrow (Padda oryzivora), really a kind of finch.

Rice-paper, a paper made in China with layers of Fatsia japonica, a tree peculiar to the island of Formosa. The pit is sometimes 1 to 1 1/2 inch in diameter. By carefully cutting this pit spirally with a very sharp knife it is opened out into a sheet of snowy whiteness. When the paper is then removed the whitening, by flattening in a press, is ready for use. The largest sheets cut are by 10 inches. It is chiefly used for making coloured drawings on. When dyed it can be made into the most perfect artificial flowers, more natural than can be produced from any other paper or fabric.

Rich, Edmund, See Edmund (ST).

Richard I., king of England, surnamed Cœur de Lion, was the third son of King Henry II. and his wife Eleanor of Aquitaine. He was born on 8th September 1157, either at Oxford or at Woodstock, but was brought up amongst the knights and troubadours of Poitou, in Aquitaine, with which country his mother's marriage, he was whilst still a child invested by his father. In England Richard did not spend in all his life a full twelvemonth; after he became king he spent only twenty-six weeks in his kingdom, seventeen weeks when he landed to take the crown and to go through the coronation ceremony at Westminster, and nine weeks when he came back from his imprisonment. It may indeed reasonably be doubted whether he could speak English. A favourite of his unprincipled mother, he was indifferently reared by her confidante, Geoffrey of Brionne, and by Geoffrey in their rebellion (1173) against their father (see Henry II.). Henry II. had his eldest son, Prince Henry, crowned king as his successor during his own lifetime; and in 1183 he ordered that his younger brothers should do homage to him. Richard obeyed with the greatest reluctance; thereupon the ungrateful Prince Henry at once picked a quarrel with him, and marched an army into his dukedom of Aquitaine. King Henry hastened to the assistance of the young duke, whilst the other brother Geoffrey sided with the prince. But the sudden sickness and death of the ingrate put an end to the quarrel. In the spring of 1189 Richard was in his turn in arms against his father. Philip of France, the pertinacious foe of King Henry, mingled in the strife; and eventually Richard joined forces with his father's enemy, did homage to him, and took the field against the old king. A reconciliation was rendered more difficult because of Richard's jealousy of John, his father's favourite.

Richard had the title of King of Jerusalem, Duke of Normandy, and Count of Anjou on 5th July 1189, and was crowned king of England on 3d September following. But he had already taken the vows of the crusader; and, besides his coronation, he had another object in coming to England: he wanted to raise funds for his crusade. He effected this
latter purpose in a brief space of time by selling whatever he could get a purchaser for. About midsummer 1190 he met Philip of France at the rendezvous, Vezelay in France; but from Lyons he made a very bad roads; Philip took him to Messina in Sicily. Both kings spent the winter at that city, and their mutual jealousy caused within a hair's-breadth of a rupture. The throne of Sicily had just been seized by the Norman Tancred, an illegitimate son of King Roger, though the lawful heir, William, still claimed the crown. Frederick Barbarossa, and afterwards the Emperor Henry VI. Moreover, Tancred detained in custody Johanna, widow of the late king (William the Good) and sister of Richard, together with her very large dowry. But he made his peace with Richard by giving up to him his sister and her possessions, and by betrothing his little daughter to the boy Arthur (son of Richard's dead brother Geoffrey), whom Richard now declared to be his heir. On his way to Palestine in the spring of 1191, part of the fleet of the English king was driven on to the island of Cyprus, and the crews were most inhospitably treated by the reigning sovereign, Isaac Comnenus, a nephew of the emperor of Byzantium, who had revolted from his liege lord. Richard sailed back from Rhodes, routed Isaac in battle, deposed him, and gave his crown to Guy of Lusignan. In Cyprus too he resolved Benjamin or Baladin, whom his mother had brought to him at Messina. At last, on 8th June, the English king landed near Acre, and shortly afterwards that stronghold surrendered, the siege having lasted two years. Richard took his full share of the jealousies, animosities, and disagreements, though not of the treacheries, that made the Christian crusading host a hotbed of commotion. The glorious exploits of Richard the Lion-hearted—his march to Joppa along the seashore, his approach upon Jerusalem at Christmastide, meeting the formidable force in Palestine, his second advance in the summer of 1192 on Jerusalem (the city he never beheld), and his relief of Joppa—made his name ring throughout the East and excited the wonder and admiration of Christendom, but brought no increase of revenue. His victories in September concluded a peace with Saladin for three years, three months, and three days, and in his impulsive, impatient way started off home alone, without waiting for his army and fleet. A storm shipwrecked him near the north end of the Adriatic, where he lingered for three months, and made his way through the dominions of his bitter enemy, the Archduke of Austria. He was recognised, seized, and handed over to the Emperor Henry VI. (March 1193). The emperor demanded a heavy ransom for his release, but promised to give him the kingdom of Arles in addition to his liberty. Richard's loyal subjects raised the money; and greatly to the chagrin of Philip of France and Richard's brother John, the captive king returned home (13th March 1194). In England in the meantime Longchamp (q.v.) had made himself so unpopular that Richard generously forgave him and made him a present of 100,000 marks, and appointed him in his place Walter of Cortances, Archbishop of Rouen. It was John, however, who exercised the greatest power in the realm. And although he used his utmost endeavours to prevent Richard's return from his captivity, yet Richard generously forgave him the 100,000 marks which Longchamp had previously paid in punishments, raising what money he could, making arrangements for the governance of the kingdom, and being crowned again—the emperor is said to have forced his captive to resign his crown and take it back as a thief of the empire—Richard proceeded to France, and spent the rest of his life there, warring against Philip. England was governed in his absence by Hubert Walter, Arch.
the subsidy on wool for life, and delegated all its authority and power to a commission of eighteen members, all supporters of the king. Richard soon aroused the slumbering discontent of his subjects by two acts of legislation: first, a prohibitory act, principally by means of forced loans, and by his arbitrary and despotic rule. In the beginning of 1398 the Duke of Norfolk and the Duke of Hereford (Henry, son of John of Gaunt) were accused to the king of having spoken treason against him. Richard immediately rode amongst his subjects, exclaiming he would be their leader, and granted them the concessions they asked. The risings in the other counties speedily collapsed when the people learned what the king had done; but during the autumn serious punishments overtook them. Seven thousand in all are said to have perished in the fighting and on the scaffold. The causes of this wide-spread and simultaneous uprising on the part of the mass of the rural population may be summarised as follows: there had been long continuance of heavy taxation; the villeins represented the reposition since the Black Death of personal services, and were anxious to become tenants of their little farms at a fixed rental; the free tillers of the soil had formed themselves into associations to defeat the Statute of Labourers (1351), which fixed the wages of the commoners; the Lollard or Wyclifite preachers were denouncing the idleness and vices of the regular clergy, and they and others (as John Ball) were promulgating social doctrines calculated to make the common people discontented with their lot and hostile to the idea of the country clergy complained of the tyranny of the church; the mismanagement of the war, and the incapacity and selfishness of the court party provoked much discontent; there were many discharged soldiers in the country, and these, and others, were sinking to a level. But from the fact that the insurgents directed their enmity against himself and the advisers of the king, John of Gaunt saw that he could never hope to succeed in his ambitious schemes in England; and from this time he kept himself in the background, until in 1383 he carried himself and his restless plottings to Spain and Gascony. Richard in 1390 made him Duke of Aquitaine for life. In 1383 Richard invaded Scottland, and took Edinburgh and burned it; but, not encountering the Scots, returned home. About the same time were the complaints of the country clergy, headed by Thomas of Woodstock, Duke of Gloucester, began to oppose the king and his chosen friends. They impeached several of them before the Merciless Parliament (1388), and secured convictions and executions. But on 5th May 1389 Richard suddenly declared himself of age, and proceeded to govern on his own responsibility. For eight years he ruled as a moderate constitutional monarch, and the country enjoyed peace—hostilities with France were not renewed after 1388—when he declared himself himself King Henry IV. Richard's first wife, Anne of Bohemia, whom he had wedded in 1382, died, and two years later he married Isabella, daughter of Charles VI. of France, a girl of eight. From that time he seems to have adopted very largely French tastes, manners, and ideas. About the same time it was said that Richard began to assert the pretensions of an absolute monarch. On 8th July he had Gloucester, Arundel, and Warwick arrested on the charge of conspiring against the crown. Arundel was beheaded; Gloucester was sent a prisoner to Calais, and died there in prison, probably murdered, a fortnight after his arrest; and Warwick was banished to the Isle of Man. Thomas Arundel, Archbishop of Canterbury, was also banished. In the following year an obsequious parliament granted to the king

When the young monarch assured them he would grant their requests, and take measures to liberate the villeins from bondage and to commute their personal services into fixed money rents. The men of the same year another condition of the labourers of London's palace, burning Temple Bar, opening the prisons, and breaking into the Tower and slaying the Archbishop of Canterbury, met the king at Smithfield (15th). During the negotiations, William Walworth, the mayor of London, struck down Wat Tyler (v. the battle of Borough). The country clergy, the king immediately rode amongst them, exclaiming that he would be their leader, and granted them the concessions they asked. The risings in the other counties speedily collapsed when the people learned what the king had done; but during the autumn serious punishments overtook them. Seven thousand in all are said to have perished in the fighting and on the scaffold. The causes of this wide-spread and simultaneous uprising on the part of the mass of the rural population may be summarised as follows: there had been long continuance of heavy taxation; the villeins represented the reposition since the Black Death of personal services, and were anxious to become tenants of their little farms at a fixed rental; the free tillers of the soil had formed themselves into associations to defeat the Statute of Labourers (1351), which fixed the wages of the commoners; the Lollard or Wyclifite preachers were denouncing the idleness and vices of the regular clergy, and they and others (as John Ball) were promulgating social doctrines calculated to make the common people discontented with their lot and hostile to the idea of the country clergy complained of the tyranny of the church; the mismanagement of the war, and the incapacity and selfishness of the court party provoked much discontent; there were many discharged soldiers in the country, and these, and others, were sinking to a level. But from the fact that the insurgents directed their enmity against himself and the advisers of the king, John of Gaunt saw that he could never hope to succeed in his ambitious schemes in England; and from this time he kept himself in the background, until in 1383 he carried himself and his restless plottings to Spain and Gascony. Richard in 1390 made him Duke of Aquitaine for life. In 1383 Richard invaded Scottland, and took Edinburgh and burned it; but, not encountering the Scots, returned home. About the same time were the complaints of the country clergy, headed by Thomas of Woodstock, Duke of Gloucester, began to oppose the king and his chosen friends. They impeached several of them before the Merciless Parliament (1388), and secured convictions and executions. But on 5th May 1389 Richard suddenly declared himself of age, and proceeded to govern on his own responsibility. For eight years he ruled as a moderate constitutional monarch, and the country enjoyed peace—hostilities with France were not renewed after 1388—when he declared himself himself King Henry IV. Richard's first wife, Anne of Bohemia, whom he had wedded in 1382, died, and two years later he married Isabella, daughter of Charles VI. of France, a girl of eight. On 8th July he had Gloucester, Arundel, and Warwick arrested on the charge of conspiring against the crown. Arundel was beheaded; Gloucester was sent a prisoner to Calais, and died there in prison, probably murdered, a fortnight after his arrest; and Warwick was banished to the Isle of Man. Thomas Arundel, Archbishop of Canterbury, was also banished. In the following year an obsequious parliament granted to the king
he married Anne, the younger daughter of War- 
wick the King-maker, who had been betrothed to 
the Duke of Buckingham. The alliance of the 
greatly resented by Clarence, who had married, 
the elder sister, and wished to keep all of War- 
vick's vast possessions in his own hands. Clarence 
quarrelled too with King Edward, who in 1478 
procured his impeachment by parliament. The 
refusal of鸾he Duke to come in private to the 
Tower on 18th February. Of this judicial murder 
Gloucester is likewise accused; but the evidence 
for his complicity is very slight. In 1482 he was 
put in command of the army that invaded Scot- 
lund. Along with the Duke of Albany he entered 
Edinburgh, and was called the Wrecker of 
Scotland. To quill the great garrison of 
Richmond at length landed at Milford Haven 
on 7th August 1485. Richard met him at Bosworth 
in Leicestershire on the 22d, and there lost his 
kingdom and his life, fighting bravely like a king, 
crown on head, in the midst of his foes (see HENRY 
VII.). The body of the slain king was subjected 
to great indignities, carried to Leicester, and there, 
after being exposed for two days, was buried in 
the Grey Friars churchyard.

Richard's was a strangely mixed character. Its 
ruining passion was an inordinate craving for power, 
which at some time or other gratified itself in 
bloody, reckless, and unscrupulous, and hence 
heinous. He possessed many of the typical 
qualities of the best of the Plantagenets—a skilful 
soldier, of great ability and energy, brave, bold, 
and不顾 of consequence, fond of display, yet not 
incapable of nobler impulses. Had he been born 
the lawful heir to the throne, and succeeded 
to it peacefully, he would probably have been a 
great king; for he was a very capable ruler, 
which the real welfare of his subjects, 
not the court. He was also swayed by a lively sense of divine justice; his generosity to his subjects had its 
foundations in his nature to the upper hand; and these grew 
and hardened as time went on, till his audacity 
and unscrupulousness were matched with a cunning 
and hypocrisy such as are seldom found united in 
one man. On the other hand, he unquestionably 
had a great charm of manner, and knew how to 
influence confidence even in those who had the best 
reasons for distrusting him. He was liberal too, 
and, where his own personal ambition was not 
directly concerned, just and generous. He was 
also swayed by a lively sense of divine justice; 
the court. He was also swayed by a lively sense of divine justice; his generosity to his subjects had its 
foundations in his nature to the upper hand; and these grew 
and hardened as time went on, till his audacity 
and unscrupulousness were matched with a cunning 
and hypocrisy such as are seldom found united in

directly concerned, just and generous. He was 
also swayed by a lively sense of divine justice;
Richard de Bury, see Aungerville.

Richard of Cirencester, an early English chronicler, whose life falls between 1335 and 1401. His name is found in 1355 in the list of monks of the Benedictine monastery of St Peter, Westminster. In 1391 he obtained a license from his abbot to visit Rome, and he died in 1401. The only known work of this extant contemporary is a translation in four books, the Speculum Historiale de Gestis Regum Angliae 1447-1600, edited for the Rolls series by Professor J. E. B. Mayor (2 vols. 1863-69). It is of some independent value for the history of Westminster Abbey and Edward the Confessor and even so late as 1868 we find it in a connection with the notorious forgery, De Situ Britanniae, long accepted, to the serious detriment of history, as an authoritative work on the antiquities of Roman Britain. This work was first printed in 1578 by its ingenious author, John Charles, but in 1850 by the reprint of 1854. Gibbon gives it a diligent study of the life of Edward the Confessor, and the chief interest of the work is its excellent translation, which is clear and concise, and in a flowing style.

Richard of Cornwall, second son of John, king of England, was born on 5th January 1200. In 1225-26 he and his uncle, William of Salisbury, came to the assistance of the pope and the next year he received Cornwall, as the result of a rising of the earls to compel the king (Henry III.) to make provision for him. He managed his money matters well, and his wealth, as well as his prudence, saved Henry in many an impending crisis. For some years he acted with the English barons, to many of whom he was closely related by his marriage with Isabel, Countess of Gloucester, daughter of the Earl of Pembroke. In 1232 he was one of the leaders in the opposition to Hubert de Burgh, and in 1233 he headed an armed rising provoked by the king's secret marriage of his sister to Simon de Montfort. But Richard was still heir to the throne, and the articles which Henry was prepared to sign, and which dismissed his foreign advisers, appeared to the earl to bind the king's hands too closely. He acted to secure his safety; and in 1240-41 Richard was away on a crusade, and the next year he was with his brother in Gascony; and in 1244 he married Sanchia of Provence, sister of Queen Eleanor, and this second marriage drew him away from the government. In 1252 he refused the position of the king's second son and went to Sicily; but in 1257 he was elected by a majority titular king of the Romans, and was soon afterwards crowned at Aix-la-Chapelle; and he was skilful enough to maintain a certain hold on Germany, lavishing his wealth to maintain his own position and the dignity of the empire. In the great struggle which took place between Henry III. and his nobles Richard at first acted as a peacemaker. Subsequently, however, he sided with his brother against Simon de Montfort, and he was imprisoned at Lewes, and imprisoned for a year, until the battle of Evesham (1265) set him free. In 1267 he was a third time married, to Beatrix, niece of the Elector of Cologne. Richard died at Kirkham, 21 April 1272, a most devoted and hearted loving father to his eldest son, Henry, who was murdered at Viterbo by the Montforts, and immortalised by Dante. Two other sons died also without issue.

Richards, Brinley, pianist and composer, was born at Carmarthen in Wales in 1819, the son of a church organist. He began to study music at the Royal Academy in London about 1835, and on the completion of his studies had won a good position in London as a pianist and teacher of music. He was for many years a professor of the Royal Academy. His compositions for sacred and part songs and for the pianoforte won great popularity, especially his 'God Bless the Prince of Wales.' Richards bestowed much attention upon the study and encouragement of Welsh music. He died on 1st May 1885.

Richarson, Sir Benjamin Ward, M.D., L.L.D., F.R.S., physician, author, and inventor, was born at Somerby, Leicestershire, 31st October 1826. He studied at Anderson's College, Glasgow, took the diploma in 1850 of the faculty of Physicians and Surgeons, and graduated in medicine at St Andrews in 1854. He was a frequent contributor to the Medical Times and Gazette, and gained the Fothergillian gold medal for an essay on 'Diseases of the Fetus in Utero,' and the Astley-Cooper prize of 300 guineas in 1856 for an essay on the 'Congestion of the Blood.' Dr Richardson's medical inventions include a double-valve inhaler for chloroform, an ether spray tube, apparatus for embalming, a mask for workers in dust, a lethal chamber for painless extinction of the life of lower animals, &c. He invented various new anaesthetics, and discovered the controlling property of amyl over tertian. He wrote and lectured on total abstinence, public health, and many medical and scientific subjects, and popularised many facts in sanitary science. He founded the Journal of Public Health in 1855 and published it monthly until 1862, and a quarterly journal, entirely written by himself, The Aseptic, in 1861 and 1884 onwards. In 1868 he was presented with 1000 guineas and a microscope by 600 of his medical brethren and friends. He was knighted in 1893, and died 21st November 1896. See his autobiographical Vita Medica (1897).

His published works and essays are numerous, including Cause of the Congestion of the Blood (1856); Alcohol, its Action and its Use (1860); Contour Lectures on Wine and Its Alcohol (1876); Hygiene, A Monthly City of Health Drinking (1879); A Review of the Life and Work of Edwin Chadwick (2 vols. 1887); Common Health (1887); National Health, or the Life of the People (1891).

Richardson, Charles, lexicographer, was born in July 1775, studied law, kept school at Clapham, received in 1832 a pension of £257, and died October 6, 1865. His first work, Illustrations of English Philology (1815), led to his undertaking an English dictionary for the Encyclopedia Metropolitana, the first volume of which appeared in January 1818. The project fell through, but Richardson's New Dictionary of the English Language at length appeared complete in two quarto volumes in 1837. The work was warmly
received—Trench styled it 'the best dictionary in the language'—and at that time it deserved the praise. A later work was entitled On the Study of Language: an Exposition of Pope's Definitions of Poetry (1834).

Richardson, Sir John, naturalist, was born at Dumfries, November 5, 1737, studied at Edinburgh University, became a 'Master', and, as one of the 'imitators', principles as his variety to in familiar Leaser Mv tenacity that 'Ikj 1740, a beautiful agreeably neltlKxI conspicuously too. Life this his the his the common He literary of Sirley afterwards came a master-piece of 1854 or the his the curious characteristics fellows motto • In 1719 Richardson, a diligent artless accidently for a newspaper, by perfecting in (1729; 1829-37) the Ichthology of the Voyage of H.M.S. Erebua and Terror (1844-48). There is a Life by the Rev. John M'gruir (1868).

Richardson, Samuel, novelist, was born in 1689 in Derbyshire. Like Matthew Prior, he was the son of a joiner; but unlike him, he made no effort to obscure his origin. My father,' he said, 'was a carpenter, and from this humble origin fell a distinguished note. My mother was also a good woman, of a family not ungentled.' His career is a curious exemplification of the truth of that Horatian precept which Thackeray chose for the motto of Esmond. It preserved to the end the chivalry of the eighteenth century, and bordered on the sentimentality of the earlier days of the century. In the life of the novel, the hero sometimes looks like a 'silent and loving shadow' on his character, and is afterwards the moralist of Salisbury Court was as a boy the 'Gravity' and 'Serious' of his schoolfellows; the novelist who penned the incomparable epistles of Clarissa and Harriet Byron was as a youth the favoured and indefatigable amanuensis of half the girls in the neighbourhood, acquitting himself in this artless office something of that strange knowledge of the minuter mechanism of the feminine mind which is so conspicuous a feature of his genius. He says of himself that he had only 'common school learning; ' but he appears to have been at Christ's Hospital. In 1706, at the age of sixteen, he was bound by his own wish to John Wilde of Stationers' Hall, a printer, with whom he served the usual period. Allington Wilde, whose daughter he married, was also a printer, but was quite distinct from his master. From 1715 to 1719 he was employed in the 'Government journal' of the House of Commons. In the latter year he opened an establishment of his own in the centre, and later in the north-west corner (No. 11) of Salisbury Square, then Salisbury Court. His printing-office and warehouses were in Blue Ball Court, on the east side of the Square. In a solange of six years he continued to prosper, perfecting his faculty for letter-writing in various ways, and serving the humbler needs of literature by diligent compilation of prefaces, indexes, advertisements, and the like. He printed more than one newspaper, and by the favour of Mr Speaker Onslow obtained the printing of the journals of the House of Commons, twenty-six volumes of which passed through his establishment. Then, in 1740, came the opportunity which transformed him into a literary celebrity. To use his own words, 'he accidentally slid into the writing of Pamela.' He was over fifty when two bookselling friends invited him to prepare a volume of familiar letters 'in a common style, on such subjects as might be of use to those country readers who were unable to indulge for themselves.' He caught at the idea, superadding another. 'Will it be any harm,' he said, 'in Pamele you want to know, if it should instruct them how they should think and act in common cases?' Hence sprang Pamela, published in November 1740. Its title was as leisurely as its method: 'Pamela; or Virtue Rewarded.' The scenes of familiar letters from a beautiful young damsel to her parents. Published in order to cultivate the principles of virtue and religion in the mind of the youth of both sexes. A narrative which has its foundation in truth; and at the same time that it agreeably entertains by a variety of curious and affecting incidents, contains delicately developed ideas, which, in too many pieces calculated for amusement only, tend to inflame the minds they should instruct.' The moral note is explicit enough on the good printer's title-page; but for all that Pamela is by no means ad usum Delphini. Its vogue, in a coarser and rollicker age than ours, was nevertheless extraordinary. Not to have read of Richardson's exemplary heroine was as 'great a sign of want of curiosity, as not to have seen the French and Italian dancers.' Divines extolled her from their pulpits; Pope declared she would do more good than the Triton of Ulysses, that prohibited her popular chronicles at times of amusement; and in remote country villages, when at last she was happily married, her rustic admirers set the bells a-ringing. In February followed a second edition; a third succeeded in March, and a fourth in May. M. Voltaire, in a letter to Richardson, declares this unexampled popularity, lastly put together for sequel a Pamela in High Life, which had the unfortunate effect of seducing Richardson into two supplementary volumes, now deservedly forgotten; and then Henry Fielding flirted the Salisbury Court device, and, producing what Richardson and his coterie regarded as the 'lew and ungenerous engratment' of Joseph Andrews. Happily, however, both for Richardson and posterity, he speedily discarded burlesque for the immortal character of Parson Abraham Adams.

Eight years elapsed before Richardson published another novel. But during this time, consoling himself for the coarse satirical of the irreverent by the 'soft adulation' of a little circle, chiefly of the gentler sex, who gathered round him in his suburban home at Hammersmith, he continued, either in his snug writing-closet or his summer-house, to work placidly at his masterpiece—Clarissa; or the Adventures of a Young Lady, known generally as Clarissa Harlowe. Virtue, in this performance, was not 'rewarded,' but ruined. The heroine is nevertheless drawn with a tenacity of insight to which there are few equals. The hero, Sebastian, the chief male character, that of Lovelace, though more of an abstraction, is scarcely inferior. Johnson declared the book to be the first in the world for its knowledge of the human heart; and even Fielding did not refuse his tribute: 'Such simplicity, such manners, such deep penetration into nature, such power to raise and alarm the passions, few writers, either ancient or modern, have been possessed of.' (Jasobite Journal, No. 5). Lesser voices swelled the chorus with greater energy, and it was repeated across the Channel with Gaillie enthusiasm. The high-priest of sentiment, Diderot, did not scruple to name its author with Homer and Euripides; and as if to prove that this was no momentary Anglomania, in our own day the poet Alfred de Musset proclaimed it to be 'le premier roman du monde.' But from France also came its compactest condemnation. 'In nature,' said D'Alembert, 'est bonne à imiter, mais non pas jusqu'à l'ennui.'

Having drawn the ideal woman in Clarissa, Richardson proceeded, some five years later, to portray, in Sir Charles Grandison, the perfect man of the modern age. He could not do this with greater ability than Pamela, but still far below Clarissa. It has, moreover, no central story strong enough to reconcile the reader to the prolix impeccability of its superb hero, whom M. Taine, with an unavowed burst of critical levity, suggests should be stuffed and canonicalised for his incomparably good qualities. Besides a solitary essay in Johnson's
Raméter (No. 97), and the voluminous but not very interesting correspondence (published with an excellent memoir) by Mrs Barland in 1894. Richelieu left no other literary remains of any importance. In later life a nervous habit grew upon him, which terminated in 1671 by a fit of apoplexy, of which he died. He has left his own portrait in his great biographer, Lady atcough (Cavendish, foil iv. 290); but it might almost have been deduced from his letters. He was a sentimental, purring, methodical, well-meaning little man, domesticated and affectionate, whose fitting environment was feminine society of the sympathetic sort; and he lived the life of a courtier, with which his worshippers tempered the wind of adverse criticism to his sensitive soul by depicting their sex in return with a patience, a discrimination, a sustained analysis of secret spring and motive which it has been given to no other male author, living or dead, to achieve the personal and the vocal testimony to his native genius that his impracticable method of telling his story by correspondence, and his intolerable circumstantiality and diffuseness (he thinks nothing of an epistle of fifteen pages, and Clarissa takes nineteen for her will) have only served to make the reader guess, to evade emphasis and intensify the reality of his creations.

A reprint of Richardson's novels, with an admirable preface by Mr Leslie Stephen, was issued in 1883. The essays of Mrs Oliphant (Blackwood, March 1869), of Mr Burford (Manchester Review, Oct. 1877, and Contemporay, xiv.), and of Mrs Andrew Lang (National Review, xiv.) all deserve the attention of the student.

Richborough. See Sandwich.

Richelieu, Armand Jean Duplessis, Cardinal, Duc de, one of the greatest statesmen of France, and, with only a black mark to his name, the most illustrious family of Richelieu, 12 miles SSE. of Chinnon, September 5, 1585. He abandoned a military career for the church, in order to keep in the family the bishopric of Luçon, to which he was consecrated at twenty-two. Representative of the Poitou clergy at the States-General in 1614, he attracted the notice of the queen-mother, and rose in 1616 to be secretary at war and foreign affairs; but the downfall of Marshal d'Ancre, the queen-regent's favourite, in April 1617, sent him back to his monastic life in August. As queen-mother and the young king were reconciled, partly through the agency of the celebrated Capuchin Father Joseph—l'éminence grise—of later days, till his death in 1638 the intimate friend of Richelieu. The latter showed much tact and patience forbearance of ill manners, he profane an Alliance in the powerful Duc de Luynes, and in 1622 was named cardinal, in 1624 minister of state. This position he retained to the end of his life, in spite of countless court intrigues, and ere long the most powerful open and secret opposition from the queen, Gaston, Duke of Orleans, and a host of minor intriguers, first among whom was the too famous Duchess de Chevreuse. His first important measure was the blow to Spain of an alliance with England, cemented by the betrothal (1625) of the king's sister Henrietta with Charles, then Prince of Wales, and the Valenciennes marriage (1628) of the country of the Spanish and papal troops, but was unable to pursue his advantage, and had to submit to the terms of the peace of Monzon (1626). His next task was to destroy the political power of the Huguenots. Without the monasteries, which he conducted in person, concentrating all his energy upon the task, the great stronghold of La Rochelle was starved into submission, 30th October 1628. He next turned to crush Rohan and the Languedoc rebels, and destroyed the proud walls of Montauban, last refuge of Huguenot independence. Early in 1630 he entered Italy with a splendid army, himself in command, and soon reduced Savoy to submission. Meanwhile he plunged into dark and torious intrigues with the Italian princes, the pope, and with the Protestants of the north against the House of Austria. He promised a large subsidy to Gustavus Adolphus, and, through the masterly diplomacy of Father Joseph at the Mortefon (1628), he succeeded in persuading Ferdinand to dismiss Wallenstein. But the treaty of Cherasco (April 1631) ended the Italian war, the second gave France the important strategic position of Pinsorlo. Just before this final triumph Richelieu had successfully surmounted the greatest danger of his career, and kept France from ruin for his downfall by the queen-mother, Gaston of Orleans, the House of Guise, Bassompierre, Créqui, and the Marillac. She tried to bully the king by her violence, but Richelieu followed his master to Versailles, and again had the whole power of the realm placed entirely in his hands. So ended 'the Day of Duperes' (11th November 1630). The queen-mother fled to Brussels, Bassompierre went to the Bastille, Gaston fled to Lorraine. The cardinal was now made duke and peer, and governor of Brittany. Further intrigues and attempted rebellions by the emigrant nobles and the great city of Paris were crushed with merciless severity—Marillac and Montmorency and other nobles were sent to the block. Meanwhile Gustavus Adolphus had run his brief and brilliant course; and his death at Lützen left Europe in ruins, and with it the chance of some difficult to reckon. In July 1632 Richelieu had seized the duchy of Lorraine. He continued his intrigues with the Protestants against Ferdinand, subsidising them with his gold, but till 1633 he took no open part in the war. In May of that year, after capturing his strongholds and concluding a close alliance with Victor Amadeus of Savoy, Bernhard of Saxe-Weimar, and the Dutch, he declared war on Spain, and at once placed in the field an army of 132,000 men. But his first efforts were singularly unsuccessful, and in 1634 Piacenza was taken and in the Netherlands, entered Picardy, crossed the Somme, and threatened Paris itself. But in this hour of peril Richelieu rose to the height of his genius, and awoke a new and irresistible force as he threw himself upon the patriotism of France. With 80,000 foot and 8000 horse he surprised Tarascon out of Picardy, while his ally Bernhard drove them across the Rhine, and in 1638 destroyed the imperial army in the decisive battle of Rheinfelden, a victory which opened to him the gates of the key-fortress of Breisach. Bernhard threw the fruit of his victories into the hands of Richelieu, whose policy soon bore further fruit in the disorganisation of the power of Spain—revolts in Catalonia, and the loss of Portugal; the victories of Wolfenbüttel (1642) and Kuenpen (1642) over the Imperialists in Germany; and at length in 1641 in Savoy also in the ascendency of the French party. Another triumph that same year was the speedy collapse of the Imperialist invasion in the north by the Count of Soissons, who perished in the first battle. The failure to capture Tarascon was one among the many; and the complete triumph of the cardinal's latest years.

But the hatred of the great French nobles to his rule had never abated, and Richelieu found safety alone in the king's sense of his own helpless and impotent situation. 'There was only the safe government for France was a strong absolutism uncontrolled either by the selfish ambition of the nobles or the constitutional legalism represented by the Parlement of Paris. The last conspiracy against him was that of the Grand-quarter, the young Cix-Mars, whose intrigues with Gaston, the Duke of Bouillon, and the
Spanish court were soon revealed to the cardinal, the centre of a network of espionage which covered the whole of France. When the hour was ripe he placed in the king’s hands at Tarascon proofs of the traitorous plot with Spain, and was given full powers as Lieutenant-general of the realm. Cinq-Mars and De Thou were all three arrested, and the whole council of Grand Pension of Orleans followed after his kind to buy his own security by betraying his accomplices. Cinq-Mars and De Thou were executed at Lyons in the autumn of 1642. But the great minister was himself dying in the hour of his greatest triumphs with talk of another near him, but the strong will and fiery soul within his frail and feeble frame had thrust him aside and retained the fleeting life. He faced the inevitable at last with calm tranquillity—when the priest bade him forgive his enemies, he made answer, ‘I have never had any other enemies than the state.’

We see the same unhumble impersonality in the identification of himself with the state in his Mémoires—‘I have been severe to some in order to be good to all. . . . It is justice that I have loved and not vengeance. . . . I wished to give Gaul a face, to make her a nation. . . . I aimed at Gaul, not at her. . . . to identify Gaul with France, and wherever the ancient Gaul had been, there to restore the new.’ He died 4th December 1642, bequeathing Mazarin to the king as his successor.

Richelieu built up the power of the French crown, he achieved for France a preponderance in Europe, and throughout his life he moved onwards to his goal with the strongest tenacity of purpose, unmoved either by fear or pity. He destroyed the local liberties of France, and crushed every element of constitutional government, and his policy overthrew the empire still standing and waste places some of her fairest provinces and most thriving towns. Our judgment of him will always differ according as we examine his end or his means—the public or the private man. He never sacrificed to personal ambition the interests of his country as these seemed to himself, but he often forgot, in his methods the laws of morality and humanity. There is no need here to discuss the more fundamental question of whether his end was actually identical with the highest good of France—the best defence that even so recondite a Chauvinist as Henry VI. can offer is to point back to the full tendencies long rooted in French soil, and that no other ideal of a policy was then possible for France but a systematised absolutism under a beneficent despot. Nor have we sympathy to spare for the corrupt and selfish nobles whom he crushed with a severity so merciless that he drove twenty-one persons into exile, all of them the greatest names in France, banished sixty-five, several of these ladies, while seventy-three nobles were flung into prison, and forty-three were either beheaded or executed in pairs.

We have the face of Richelieu best from Philippe de Champaigne’s picture in the Louvre, in which the energy of the model had passed into the hand of the artist. A pale appearance, the mere ghost of a great man in Michelé’s phrase, neither flesh nor blood, but all intellect, as Quinet said of Voltaire, he possessed the same sternly and penetrating eye and that imperious gesture that overawed the king and the proudest peers of France.

The weakest point in Richelieu’s character was his literary ambition and the extraordinary pains he took to adorn the literary reputation. His own plays, for the most part written with anxiety, sleep in safe oblivion, but his Mémoires are still read with interest, forming a subtle and elaborate panegyric upon himself, so that Michelé says in his paradoxical manner, yet not without truth, ‘If one would not know Richelieu, one should read his Mémoires.’ He founded the French Academy. His Correspondence and State Papers, edited by d’Avenel, fill 8 vols. of the Collection de Documents inédits sur l’Histoire de France (1853-77).

See the article FRANCE; Capefigue, Richelieu, Mazarin, et Le Frontenac (2d ed. 1844), and De Cord, de Richelieu (1865); Dussieux, Le Cardinal, Richelieu (1885); D’Avenel, Richelieu et la Monarchie absolue (3 vols. 1834-89); Hanoix, Histoire du Cardinal, de Richelieu (1883).

Richmond, an ancient municipal borough in the North Riding of Yorkshire, on the left bank of the deep-valleyed Swale, 40 miles by a tramline NW. of York. Its Norman castle (1072-1146), now utilised for barracks, stores, &c., has a very fine banqueting-hall and a keep 100 feet high. Other buildings are the parish church (restored by Scott, 1800), with good wood-carvings, Queen Elizabeth’s grammar-school (1567; rebuilt, 1849-68); the market-house (1854); and the Perpendicular tower of a Franciscan friary, founded in 1258. The racecourse (847 feet above sea-level) commands a magnificent view. Till 1867 Richmond returned two members, and then till 1885, 4 Pop. (1851) 4106; (1881) 4264; (1891) 4107. The latter year 1891 the title of Richmond was conferred by the Conqueror on his kinsman, Alan Rufus, son of the Count of Brittany, and, coming into the possession of the crown through John of Gaunt, was granted by Henry VI. to the father of Henry VII. Henry VII. created his natural son, Henry Fitzroy (1517-36), Duke of Richmond, as Charles II. did his natural son, Charles Lennox (1672-1723), the ancestor of the present Duke of Richmond and Gordon.

See works by R. Gale (Latin, 1722), Clarkson (1821), Whitaker (2 vols. 1823), Robinson (1833), and Longstaile (1834, 1837).

Richmond, a town of Surrey, 8½ miles WSW. of London (by rail 9½ by river 16), stands partly on the summit and declivity of Richmond Hill, and partly on the level right bank of the Thames. The Terrace, stretching along the brow of the hill, commands an unrivalled prospect of hill and dale, woodland and winding stream; and one of the fairest river-views in England may be gained from Richmond Bridge, which, 100 yards long, was built in 1774-77 at a cost of £26,000. Only a gateway remains of the ancient royal palace of Sheen, where died Edward the Confessor (1066) and Henry VI. was born. The time of Richmond was conferred by Charles I. in 1631, remains. It covers 2253 acres, and its brick wall is nearly 8 miles in circumference. Scott here makes Jennie Dean have her audience with Queen Caroline. The well-known ‘Star and Garter’, which dates from 1738, was largely improved by Sir Hakewill shots in 1872-74 at a cost of £249,000; its banqueting-house escaped, built by Barry in 1865. At the parish church are buried the poet Thomson, Keats, Lady D. Beauchler, and Dr John Moore; and here, too, Swift’s Stella was baptised. St Matthew’s (1855) is a well-designed church, but the clock tower, 195 feet high; and there are also a Wesleyan theological college (1834), a free library (1881), &c.; whilst Richmond worthies other than those above mentioned have been Reynolds, Gainsborough, Collins, and Earl Russell. Market and nursery gardening are carried on a large scale. It was incorporated as a municipal borough in 1850. Pop. (1861) 7423; (1881) 19,066; (1891) 22,084. See R. Crisp’s Richmond (1866); Round Richmond (1881); and E. B. Chancellor’s Historical Richmond (1883).
RICHMOND

Richmond, (1) capital of Wayne county, Indiana, on the East Fork of Whitewater River, 69 miles by rail NW. of Cincinnati, and 68 E. of Indianapolis. It was founded by the Society of Friends and Philadelphia College for women, here, for both sexes. There are manufactures of agricultural implements, machinery, boilers, flour, &c. Pop. (1880) 12,743; (1900) 18,266.—(2) Capital of Madison county, Kentucky, 119 miles by rail S. by W. of Cincinnati. It is the seat of the Central University (1873) and the Madison Female Institute. Pop. (1900) 4653.

(3) The capital of Virginia, on the left bank of the James River (here crossed by a number of bridges), at the head of tide water, about 150 miles from its mouth, and 116 miles by rail S. of Washington. It is a port of entry, and vessels drawing 14 feet of water can come up to the lower end of the city, where there are large docks. Richmond is picturesquely situated on a group of hills, the summit of one—Snowoke Hill—being occupied by the capitol (1793), which contains valuable colonial archives and portraits; it possesses also a marble statue of Washington by Houdon, and in its grounds are statues of Henry Clay and Stonewall Jackson, and the Washington monument, a noble bronze group by Thomas Crawford. Patrick Henry was a Rector of the University, and President Monroe in Hollywood Cemetery, where also is a Confederate monument 90 feet high. Among other notable public buildings are the governor's mansion, the new city hall, custom-house and post-office, pententinty, and several alphaeta.

The chief churches are the Richmond College (Baptist; 1832) and the Virginia Medical College. The James River Falls here supply immense water-power, and in 1890 the city contained 783 manufacturing establishments, employing 21,618 hands, with a capital of $16,596,500. Among the manufacturing concerns are 21 tobacco-factories (employing 8792 people), great rolling-mills, iron-foundries, nail-works, machine- and locomotive-works, flour, meat-flour, and paper-mills, and fertiliser-works. Five railways meet at Richmond, which is a terminus also of the James River and Kanawha Canal; and there are regular steamers to New York, Philadelphia, and Baltimore. The chief exports are cotton, flour, and tobacco. Richmond was founded in 1737, and became the capital in 1779. On 26th December 1811 the burning of a theatre destroyed the lives of sixty persons, and wounded hundreds of the spectators. In 1861 Richmond was selected as the Confederate capital, and from that period was the objective point of the Union armies in the east, and defended by General Lee with a large army and formidable lines of earthworks (which eventually extended for nearly 40 miles), until the seizure of the lines of supply by Generals Grant and Sheridan compelled its evacuation, after almost a year's siege and a series of sanguinary battles, on the night of April 2, 1865. A considerable number of the Confederate generals, ministers, and members of the legislature that was held by the retreating Confederates. But in the quarter of a century that followed Richmond recovered her old beauty, and more than her old prosperity and importance. In 1888 an 'agricultural, mechanical, and tobacco exposition' was held here. Pop. (1870) 93,928; (1880) 63,690; (1890) 81,383; (1900) 85,050. See the articles McCLELLAN, GRANT, LEW, UNITED STATES.

Richmond, LEIGH, author of the Dairyman's Daughter, was born at Liverpool, 29th January 1772, and while a child was lamed for life by leaning from a wall. He was educated at Cambridge, and was appointed in 1798 to the joint curacies of Radling and Yaverland in the Isle of Wight, in 1805 to the rectory of Turvey in Bedfordshire, where he died, 5th May 1827. He wrote Fathers of the English Church and Domestic Portraiture—memoirs of his three deceased children—and in a happier hour his Dairyman's Daughter, Negro Serenades, and Young Couple, three well-knit and logical tracts which have carried his name over the world. Collected they form Annals of the Poor (1814). See the Memoirs by the Rev. T. S. Grimshawe (1828; ed. by Bishop G. T. Bedell, Phila., 1848).

Richter, JOHANN PAUL FRIEDRICH, usually known by his pen-name of JEAN PAUL (with the French pronunciation), Germany's greatest humorist, was born on the first of May (21st March) 1763, in Wunsiedel, a little town of the sequestered pine-clad Fichtelgebirge in North Bavaria. The imaginative boy was brought up in the idyllic sabbath-life of the mountain villages in which his father was pastor, went to school at the town of Hof, and in 1781 was sent to Leipzig University to study theology. But, like Lessing, he did not study theology; Rousseau and Voltaire, Swift and Sterne, Pope and Young, had much stronger attractions for him, and he too resolved to write books. He asserted his independence of custom by discarding the periwig and stiff necktie, wore his hair long, his shirt and vest open at the throat, and dressed him as he pleased. But he found it harder to get work for himself, and assert his position as an 'enamnciated' youth. Being poor, he got into debt all round, and in November 1784 fled secretly from Leipzig, to go and hide his head in the poverty-stricken home of his mother (a penniless widow since 1779) at Hof. His first book, Children and Children's were satires; but he could get no publisher to introduce them to the world, until in 1783 Voss of Berlin gave him forty louis d'or for The Greeneland Love-suits. The book was a failure. For three years Jean Paul struggled to support his mother and to feed bread, helping with the few florins he earned by his pen. He read enormously, omnivorously, and sat hours making excerpts from the books he devoured—a practice he kept up from early boyhood to old age. These many folios of closely-written materials were the storehouses upon which he drew for materials when he came to write his romances. He took long rambles amongst the hills and forests, his hair flying in the wind, a book in his hand or a song on his lips, and a favourite dog at his heels. In the beginning of 1787 he began to teach the children of different families in the district, and of course taught by original methods. All this time he still went on writing, and during his nine years of tutorship produced, amongst other things, the satirical Extracts from the Devil's Papers (1789), Faust's Journey (1796), and Freudel's Complaint (1796), the last two amongst the best examples of his satirico-humoristic writings; the beautiful idyls Dominc Wa/z (1798), Quintus Fecline (1796; Eng. trans. by Carlyle, 1827), the Parson's Jubilee (1797), the first two perhaps the most finished works by him, and among them his first novel, The Invisible Lodge (1793), Hesperus (1795; Eng. trans. 1865), and Flower, Fruit, and Thorn Pieces, or Siebenkäs (1796-97; Eng. trans. by Noel 1844 and 1871, by Ewing 1877); Campanerthol (1797; Eng. trans. 1857), a series of impromptu anonymous satires; the unperverted reverse book; and the prose lyrical idyll, My Prospective Autobiography (1799). The Invisible Lodge was his first literary success; Hesperus made him famous. In 1790 Charlotte von Kalb, perhaps the most remarkable, certainly the most advanced, woman of her age in Germany, wrote to express her admiration of the book; and a few months later, at her invitation, Jean Paul visited Weimar. There Goethe received him politely, but with cool reserve; that, too, was Schiller's attitude,
when Jean Paul went on to Jena to see him. The antagonism between them was deep and final, a titanic struggle, yet ill concealed by all three. Herder and his wife, on the other hand, greeted the young romance-writer with overflowing admiration, and gave him their friendship, which also endured till death. As for Charlotte von Kalb, she did not stop at friendship; in Spandau already, she exercised her sex’s pledged privilege of leap-year—her first letter to him was dated 29th February—and gave him unasked the love of her vehement heart.

From this time for a few years Jean Paul's life was rich in incident and full of excitement. One of the gin-stores fathers, in which he was the object of extravagant idolatry on the part of the women of Germany, especially of aristocratic damsels who dabbled in literature. They gave him their love whether or not, and would have deserted husband and children for his sake; for, though not personally handsome, Jean Paul had a wonderful fascination of manner, particularly towards women. He found all women charming, he was a delightful talker and a good listener, and had a sweet and sympathetic smile—qualities that explain a good deal. In 1800, when he was 29, he married a Berlin lady, and three years later settled down at Bayreuth, attracted by its beauties of hill and valley, and by its beer. There he spent the rest of his days, leading a simple, busy life, writing his books, playing with his children, tending his pet animals, and taking short pilgrimages to the different towns in Germany; the present of a flower filled him with perfect joy. His last years were clouded by the death of his only son, a promising student, in 1821, and by his own blindness. From 1799 he enjoyed a pension from the Prince-primate of Hessen, and then from the King of Bavaria. He died on 14th November 1823.

The principal events of his married life were the two grand romances, Titan (1800–3; Eng. trans. 1862) and Wild Oats (1804–5; Eng. trans. as Walt and Vilt, 1849). The former, accounted by himself and by most German critics his masterpiece, though Englishmen would generally prefer the latter, as they would certainly prefer Siebenkäs to Hesperus; Schmetteck's Journey to Flitz (1809; Eng. trans. by Carlyle, 1827) and Dr Katzenberger's Trip to the Spa (1809), the best two of his satirico-humorous writings; the idyll Fischer's Life (1819), the fragment of the greater grand romance, Nicholas Markgraf, or The Comet (1820–22); a series of reflections on Literature (Vorschule der Ästhetik; improved ed. 1812), containing many excellent things about poetry, humour, wit, style; another series on Education (Lehrsam, 1807; Eng. trans. 1848, 1876, and 1887), a book that ranks with Rousseau's Émile as a standard work on training the young, and is full of everlasting wisdom; various patriotic writings (1808–12); and an unfinished Autobiography (1826), the finest of all his works.

Jean Paul stands apart entirely by himself in German literature, a humorist of the first water, a Titan, 'a colossal spirit, a lofty and original thinker, a genuine poet [in prose], a high-minded, true, and most amiable man... He advances not with a man of understanding, with his mind, intellect, and pathos, and wit, and humour, and imagination, moving onward like a mighty host, motley, ponderous, irregular, irresistible. He is not airy, sparkling, and precise, but deep, bilious, and vast' (Carlyle). 'Two irreconcilable tendencies simultaneously present in him—lachrymose sentimentality, that shrank from the rough buffets of life, and sought refuge in emotional dissipation, luxuriating in tears, crying sorrow, consisting with love, melting in melancholy longings for the world beyond the grave; and a short, sharp, wide-awake sense that saw everyday realities with the utmost clearness and discrimination. All his great qualities of imagination and intellect were, however, made ministers to his humour, which had the widest range, moving from the petty follies of individual men and the absurdities of modern life up to the paradoxes that are rooted in the permanent ordinances of the universe. He turns his irony—a tender, reverent, playful irony—upon all the relations of human life, even upon the holiest beliefs of his own heart. And, in spite of the eccentricities of the enquirer, he felt so strongly in him, Jean Paul had the heart of a truly great and good man. Börne calls him the author par excellence of the lovely born, the poverty-striken, the neglected, and the despised; to this class belong some of his finest characters, as Waz, Fixlein, Siebenkäs, Vilt. As a master of pathos is put by De Quincey above Sterne. Few, if any, have written with such tender love and such delicate feeling of the idyllic joys of the country and the happiness of simple domestic life, particularly in the schoolhouse and parsonage. He had a wonderful vein of sympathy, and the closest nature of woman, but has not created more than one life-like woman (Lenette). Yet the male characters of his books, in so far as they are humorous, are generally living beings, or else, if secondary characters, well-drawn pencil sketches; in outline, Jean Paul is the classic author of friendships (Siebenkäs and Leibgeber, Walt and Vilt); he matched them with his own friendship for Herrmann and Oertel, and for Otto and the Jew Emmanuel Osmond. Nature was to him a living and divine presence: he loved her reverently, from the solemn and abject, through the sublime. His descriptions of nature embrace some of the loftiest hymns the spirit of man has chanted to the beauty and sublimity of created things—e.g., several passages in Hesperus and Wild Oats, the Dream of the Universe in Siebenkäs. God and the immortality of the soul were the great facts ever present to his mind, influencing all his thoughts. An enduring sense of the ethical worth of human action, 'a noble reverence for the spirit of all goodness forms the crown and glory of his culture' (Carlyle). The reason why he is so little known, except by name, is that the English (1812) is the most difficult to read, and it may be added to understand. No reader who has not the strongest constitution can struggle through the tangled thicket of encyclopedic learning, the tortuous wit, the dreyish wastes of digression and dullness, the holiness of tropical sentimentalism, amid which the gem-like gardens of his creative art are hidden. His prose is harder to translate than Heine's verse. For literary form, for order, harmony, or restraint he has not the slightest respect. The principal idea in his (often) long sentences is too frequently obscured amid a shower of qualifying clauses. The story is chiefly a peg for Jean Paul to hang Jean Paul's self-communings and reflections upon, a point d'appui for the play of his wit and humour. The wildest improbableities, the wildest extravagancies of fancy, are indulged in without restraint, but with a fine, learned, and learned, with allusions, analogies, images, metaphors, similes, tumbling one over another in inextricable confusion. A Creusis of idios, he is the greatest and most prolific word-coiner in the language: he compels words to adapt themselves to his ideas, as a dreamer indulges in a dream of his own. He is bombastic, and his literary taste execrable; yet when he is at his best his language marches with a majesty, a dignity, a natural beauty that are seldom matched in German literature. Carlyle's
RICHTHOVEN

Sartor Resartus and French Revolution are steeped in the spirit of Jean Paul, and show how greatly he fascinated the imagination of the rugged Scotsman.

The best editions of Jean Paul’s Werke are the editions of 1860–62 (34 vols., 1879 (90 parts), and 1882 et seq. (Kürschner’s Deutsche National-Literatur series). The best edition of his letters is that of Otto and Forster (1827–33); Spazier’s Biographischer Kommentar zu Jean Paul’s Werken (5 vols. 1833); Förster’s Denkwürdigkeiten (4 vols. 1865); Correspondence between Jean Paul and Otto von Goethe with Charlotte von Stein, 1826–33 (1826), and Voss (1833); and Fr. Vischer’s Kritische Gänge (new series, vol. vi. 1875). In English the best accounts are contained in Carlyle’s Miscellaneous Essays (vols. i. and iii.); De Quincey’s Anatomia of specimens passages translated (vol. xi. of Collected Works); and Life of Jean Paul F. Richter (1843). Lady Chatterton published a collection of translated extracts in 1830.

RICHTHOFEN, Ferdinand, Baron von, traveller and geographer, was born at Karlsruhe in Silesia, on Nov. 14, 1815, and educated at the universities of Berlin, and at the Geological Institute of Vienna (1856), and in 1890 accompanied a Prussian expedition to eastern Asia. The next twelve years he spent in travelling through Java, Siam, Burmah, China, Tibet, and France, and in 1868–72. After returning to Europe (1872) he was appointed president of the Berlin Geographical Society (1873–78), professor of Geography at Bonn (1875), and of Geography at Leipzig (1883) and at Berlin (1886). His reputation as a geographer is built principally upon his great work on China (Berlin, 4 vols. 1877–81), and upon Die Metalproduktion Kaltlandis (1862), The National System of Volcanic Rocks (San Francisco, 1867), Anfangen und Methoden der heutigen Geographie (1883), and numerous articles in geographical journals. Died in 1888.

RICINUS. See CASTER-OIL.

Ricketts (according to Skert, akin to A.S. riquen, ‘to wring’), or RICHTER (Dr. Glisson’s posthumous friend, died in 1650), is a term for the ‘spine,’ because a peculiar form of spinal curvature results therefrom, is a disease of children, chiefly characterised by the imperfect development, softness, and consequent distortion of some or many of the bones. The bones thus affected consist of a sort of soft bone, which will bend without breaking; and they are so soft that they may be cut with the knife. Though so soft, they are thickened, especially at the parts where growth normally takes place most rapidly; the enlargement of the wrists, ankles, &c., which results has led to the term ‘double-jointed,’ often applied to those suffering from the disease. The weight of the body and the action of the muscles acting on bones thus constructed cause them to bend, and the thighs or shins are abnormally arched, or the spine is curved, in slighter or greater degree; and only the normal form of the ankle is modified. In aggravated cases the chest is so affected as to give rise to the condition known as ‘pigeon-breasted;’ the lower jaw is imperfectly developed, and the teeth project; and the pelvis becomes so altered in form as to render walking difficult and walking in the highest degree perilous. Ricketts is exclusively a disease of childhood, and rarely begins later than the second year. It appears to be caused by unhealthy surroundings, particularly defective or improper food, and insufficient light and air. It is frequently more common among the poorer classes, and in towns. It is not due in most cases to the want of lime-salts in the food, but to the want of power in the child’s system to assimilate them. In some of the large cities of Europe one-third or even a larger proportion of the children brought to the out-patient departments of hospitals are more or less affected. It is a very chronic disease, and if at all severe leaves its mark on the bones for life. It is very rarely fatal of itself; but Gaertner and Baur believe it to be a cause in others to resist attacks of other diseases (brucellosis, diarrhoea, hooping-cough, measles, &c.). In Germany this malady is, under an old misapprehension, called the ‘English disease.’

The treatment must be mainly directed to the improvement of the general health. Free exposure to pure bracing air, sponging with sea-water, or sea-bathing if the little patient can bear it, an abundance of suitable and nourishing food, cod-liver oil, iron, and quinia include all that need be said about general treatment. The administration of lime-salts seems to do little good, though it might naturally be thought the one thing needful. While the bones are still soft great care must be taken to keep the child in such attitudes as will cause the least possible strain upon the bones that are not yet ossified and so fixed in faulty positions surgical interference may often be useful in producing amelioration of the condition.

RICKMAN, Thomas, an English architect, was born at Maidenhead in Berkshire in 1776. He was undecided as to a calling, being in succession chemist, grocer, corn-factor, and insurance agent. But he seems to have always had a love for architecture, and to have studied it carefully. Having sent in a design for a church that proved successful in a government competition, he settled at Birmingham as an architect. He designed a great number of affected children are much less able in Birmingham, Hampton Lucy, Bristol, Preston, Carlisle, &c., many country-houses, and the New Buildings of St John’s College, Cambridge. He died in March 1841. His Attempt to discriminate the Styles of Architecture in England from the Conquest to the Reformation (1817; 6th ed. by J. H. Parker, 1862) is still a standard authority.

RICKMANSWORTH, a town of Hertfordshire, at the confluence of the Colne, Gade, and Chess, 4 miles W. by S. of Watford. It has a church (rebuilt in 1890) with interesting monuments; and near it is Moor Park, the seat of the ill-fated Duke of Monmouth, who was beheaded (1821) 6211; (1881) 7672. See R. Bayne’s Historical Sketch (1870).

RICOCHET, in Artillery, is the bounding of a shot along the ground which takes place when a gun is fired low. Intentional ricochet firing was first introduced by Vauban at Philipburg in 1688, believing it to have great actual and moral effect in clearing the face of a ravelling, bastion, or other rather long line of fortification.

RICOH, Philipe, a French physician, was born on 10th December 1800, at Baltimore, U.S. He came to Paris in 1820, and after 1828 delivered there two annual courses of lectures at the Pitie on surgical operations, and was appointed surgeon-chief to the public hospitals for venereal diseases. This post he held till his retirement in October 1860. He died on 22d October 1889. Ricord won a world-wide reputation in the specialty which he had chosen, a reputation which he owed to his combination of surgical skill, physiological knowledge, manual dexterity as a surgeon, and felicitous inventiveness and resource as a physician.

The more important of his numerous works are On the Employment of the Speculum (1833); Treatise on Venereal Maladies (1838); On Blennorrhagic Ophthalmia (1843); Iconographie Clinic of the Venereal Hospital (1841–60); Letters on Syphilis (3d ed. 1863); and Lectures on Cancer (2d ed. 1860).
Riddles (A.S. réddels, from reddan, ‘to interpret’), or Sense-Riddles, to adopt Dr Tylor’s phrase, have been defined as ‘roundabout definitions of the heavier kind to guess at’. They resemble what M. B. Miller in his Dictionary as to-day they are popular among many half-civilised races—not absolute savages, for to perceive an anomaly demands some measure of culture. They may be broadly divided into two classes—riddles admitting of more or less easy solution and riddles whose solution at any wit of man, unless indeed, as is very often the case, the answer is known already. To the former class belong the enigma propounded by the Sphinx to Oedipus (q.v.), and that which, according to Plutarch, Homer died of chagrin at not being able to solve. The latter kind seems to us easy now, for it was the one about the two boys who went hunting: all they caught they flung away, and all they could catch they carried home. Of insoluble riddles Samson’s is a good instance, and this which, in a Russian folk-tale, is put by ‘Boots’ to the princess: ‘As I came to you I saw on the way what was bad, and I struck the bad with a bad thing, and of what was bad the bad died.’ Naturally the princess could not guess that he had killed a snake with his lance; she gave it up, and had to marry him. Such propounding of riddles by sages (here it should be a hearer in the sense of the instance) meets us frequently. Josephus relates how Solomon and Hiram, King of Tyre, once had a contest, in which Solomon first won a large sum of money from Hiram, but presently lost it all back to Hiram’s subject Abdonius. The Queen of Sheba, again, came to pose the wise king with enigmas (‘venit tentare eum amagialisus, so it runs in the Vulgate); the trials of skill between Virgil’s shepherds are a standard classical instance; and, to come down to later times, the Russian folk-tale has many analogues in other folklore halls of our own ballad minstrelsy—e.g. in ‘Proud Lady Margaret’, ‘Captain Weilderbough’, and ‘The Elin Knight.’

The riddle is found in the Koran, and several collections of riddles exist in Arabic and Persian. They were, it seems, also known to the ancient Egyptians. Among the Greeks they were allied in the earliest times with the oracular responses, and, like Samson’s riddle, were generally in poetical form. But in Greece they first came into vogue about the time of the Seven Sages, one of whom, Cleobulus, was celebrated for the feat of reciting the Iliad on his memory. Many greater poets did not disdain to introduce them into their writings, or to devote whole poems to the subject—e.g. the Syrinx, commonly ascribed to Theocritus. Appuleius wrote a Liber Ludiorum et Graiporum, but it is lost; and almost the only name we can fix upon is that of Celsus Firmianus Synopus, whose riddles, comprising a hundred hexameter triplets, are termed by St Aldehelm ‘rubbish’ (‘carmina inepta’).

The riddle, but more perhaps as an amusement for the barnyard bull on winter nights, or for the monkey testatory, than as a serious intellectual effort, was much cultivated during the middle ages. Many French, English, and German riddle-books exist in MS., and some were printed at an early period. Wynkyn de Worde’s Demunadys Joyous (1511) contains several riddles that are simply crude rhymes, and as such even the simple faith of medieval Christendom—e.g. ‘Demand: What bare the best gardener that ever was borne? Response: The ass that carried our Lady when she fled with our Lord into Egypt.’

The Reformation checked, if it did not wholly stop, the merry pastime of riddle-making; but in France, in the 17th century, it began to creep back into favour, until at last riddles riddled in popu-

Riding

Riding (Scand. thridding or tridding, ‘third part’), a term applied to the three parts into which the county of York is divided, termed respectively East, West, and North Riding. A similar division existed in several other countries as the Saxon period, as the laths of Kent, the rapes of Sussex, the parts of Lincoln. In Domesday Book Yorkshire was divided, as at present, into three ridings, and subdivided into wapentakes.

Riding and Driving

The art of riding may be divided into (1) ordinary riding, (2) school riding (as at Windsor, Eton, Harrow, and Cowley), and (3) riding for sport or hunting. The two objects aimed at in ordinary riding (which includes riding on the road, hunting, pig-sticking, stock-driving, breaking in young and freshly handled horses, playing polo, race and steeplechase riding) are to retain in the saddle and to make the animal carry its rider with the greatest possible ease to itself. The former of these objects is the one almost entirely aimed at by the breaker when giving his first lessons; the latter, by the flat-race jockey. Hence we find that the saddle and seat adopted by the Colonial backjumping rider are those that are best suited for ‘stocking on.’ The large pads on the flaps of his saddle are about six inches deep, and are curved backward, so as to fit against his thighs, a little above the knees, in a manner similar to that in which the third crutch (or leaping head) acts on the lady’s back. These extraordinary and illusory effects, instead of being in which most security can be obtained, is the one by which the rider can best conform to the movements of his mount. Hence we find that, even in Australia, many of the best jockeys on the flat are but very poor performers on a backjumper. In all kinds of riding balance rather than grip should be the chief means for retaining one’s seat in the saddle, for if muscular
action be constantly employed to 'stick on' the muscles then brought into play will soon become tired, and will be unable to act at the very moment their aid is most required. One valuable rule in riding is, until the leg to the animal's side, the leg from the knee down should remain firm, so that neither knee nor foot will work backwards or forwards. The movements of the upper part of the body should be regulated by the play of the hips. There should be no hollowing out of the small of the back or pushing out of the chest, or any other action which is put on the outside, so that the great reason why any approach to stiffness, when riding, should be avoided is that it has to be maintained by muscular effort and is consequently followed by fatigue. As soon as the muscles become tired they are weak and low and can consequently, if they be kept stiff (or, more correctly speaking, in a contracted condition) they will be unable to do any work they may be called upon to perform in an effective manner as they would do were they kept loose. Hence a person should ride in correct form and position, and the moment comes to put forth the required muscular effort. The rider should endeavour to avoid the two very common faults of holding on by the reins and of putting too much weight on the stirrups, and he should try to ride with his seat well back, and not 'stick on.' If he finds that he is insecure in his saddle he should allow no false shame to prevent him from getting one in which he will have a firmer hold. To give this additional grip the saddle may be covered with buckskin, or with leather, or with leather side of back and saddle. The English style of riding, which has been adopted with marked success in the hunting-field, racecourse, steeplechase-course, and polo-ground, is treated clearly and systematically in Captain Hayes's Riding (Thacker & Co., 3d ed.), a work which is the best known advice given in that excellent work, Colonel Greenwood's Hints on Horsemanship (Moxon & Co., London). In the Badminton Library book on Riding (Longmans, Green, & Co.) this subject is treated from the old-fashioned riding-school point of view, at which we shall presently return.

In school riding the object of getting the horse to carry his rider with the greatest possible ease to himself, which is the chief aim of the ordinary rider, is sacrificed to a large extent for increased control, so as to get the horse to perform the various actes de manège with precision. The English military riding system is a kind of compromise between that of the continental haute école and the English hunting style. Although grand improvements have been made in high school riding in France and Germany, instruction contained in The Cavalry Regulations has remained practically unaltered for the past thirty years. M. Baucher, we may remark, was the great master of school equitation of the previous generation. His system has been much modified for the better by Colonel Greenwood. M. Filius, though these masters differ in some details from each other, M. Barroil's Art Équestre (Rotterdam, Paris) is moulded on the teaching of Bauche. Principes de Dressage et d'Equitation (Marpon and Flammarion, Paris), by M. Filius, is a work of much use in matters of Equitation ottantaine, and should be carefully studied by the student. Previous to their appearance Mr E. L. Anderson wrote Modern Horsemanship on the same subject; but it is neither so elaborate nor so instructive as either of the other two, which ought to be read conjointly. Of the two we prefer that of M. Filius, especially as he teaches that the horse should carry his head in a freer and less fatiguing manner than M. Baucher. In the respect follows the instruction of Baucher. In M. Filius's book there are some valuable commentaires sur Baucher.

Although exhibitions of school riding are often given in a circus, we must separate it from circus riding, which consists of acrobatic performances (standing, leaping, dancing, and tumbling) in an upright position, either on a pad or on the bare back of a horse. The only part which we could term riding, in the usual sense of the term, is the 'bounding jockey act,' in which the 'artist,' while riding round the ring, takes off his saddle, stands on it, gets off his horse, and jumps astride on him and on top of his back while the animal is galloping round.

In saddle riding the lady depends for security of seat on the stirrup, and if she has on the upper and lower crutches. Her right leg is placed over the former, and she presses her left leg, a little above the knee, against the latter when she seeks her aid. Her left foot should not be placed 'home' in the stirrup, but only as far as the ball of the foot ; that is to say, [1524] If, when her left leg is held in this manner, she can just feel the pressure of the lower crutch, the length of her stirrup will be about right. The only pace at which she should put weight on the stirrup is the trot. The great requisition for obtaining a 'square' seat is that the rider should take the right advice given in that excellent work, Colonel Greenwood's Hints on Horsemanship (Moxon & Co., London). In the Badminton Library book on Riding (Longmans, Green, & Co.) this subject is treated from the old-fashioned riding-school point of view, at which we shall presently return.

The art of driving is studied in Great Britain chiefly with a view of having the horses in perfect control, which is necessitated by the hilly nature of the country and by the crowded condition of the thoroughfares in the cities and towns. In America and Australia there are better opportunities for fast driving. Hence in England a showy style of trotting is sought for, while the speed is more thought of in the United States and in the Antipodes. Although strenuous efforts are being made to establish trotting as a sport in Britain, and trotting meetings are often held at the Alexandra Park, Liverpool, and elsewhere, we greatly doubt whether it will obtain any permanent footing.

The best books on driving are Driving (Badminton Library); Riding and Driving, by J. H. Walsh; Coaching, by Lord W. P. Lennox; Down the Road, by C. T. Reinhart-Reynolds; and The Art of Driving, by M. Filius. Miss Ridley publishes horse-racing and trotting books.
both universities; Tyndale and Blilney had taught the new doctrines at Cambridge, and Ridley, no less than Cranmer and Latimer, Cambridge students about the same period, had early caught something of their spirit. Ridley went next to Leiden, as it was, and, like Tyndale, met with some of the most active Reformers abroad, after a three years' absence returned firmly grounded in the new doctrines. He was made proctor to the university of Cambridge in 1533, became domestic chaplain to Cranmer, afterwards to the king, and had already been made vicar of Herring-cam, near Westminster, then of Canterbury, and rector of Soham, when in 1547 he was raised to be Bishop of Rochester. An ardent and outspoken Reformer, yet without either bigotry or intolerance, he brought great learning and admirable preaching power to the cause, and quickly made himself one of the foremost leaders of the church. On the deprivation of Bonner, Bishop of London, in 1550, Ridley became his successor. In this high position he distinguished himself by his moderation, his learning, and his munificence, prompted Edward VI. to found St Bartholomew's Hospital and St Thomas' hospitals, and assisted Cranmer in the preparation of the Forty-one Articles, afterwards reduced to thirty-nine. In 1552 he visited the Princess Mary at Hunsdon, but failed to shake her adherence to her mother's faith. Thereupon, after the accession of Mary I., he was imprisoned for the cause of Lady Jane Grey, and at St Paul's Cross declared both Mary and Elizabeth to be illegitimate, July 16, 1553. As soon, however, as Mary was proclaimed he repaired to Framlingham to maintain his house, but he was coldly received, and soon stripped of his dignities and sent to the Tower. Once at least he attended mass, but his spirit soon returned to him. In March 1554 he was sent to Oxford, together with Latimer and Cranmer, to be tried by a committee of convocation, and after a fall the nobled and tawdry collar round his neck, he was adjudged defeated and obstinate heretics, and condemned to suffer at the stake. As England was not yet formally reconciled to Rome, the sentence could not be carried out, and accordingly Ridley lay in Bocardo gaol at Oxford for eighteen months, writing the whitsun and the tithing a foreword letter to his friends. After the formality of a second trial he was led forth to execution, along with Latimer, 16th October 1555. The stake was placed in front of Balliol College, and there Ridley played the man in the midst of awful torments of a smouldering fire that burned him slowly to death. His writings were collected in a volume of the Parker Society series (1841), with a life by Rev. H. Christmas. See his Life by Dr Gloneester Ridley (1763).

Richm, Eduard (Karl August), a learned Protestant theologian, born at Diersburg in Baden, December 29, 1830. He studied at Heidelberg and Halle, became Very at Durham in 1858, garrison preacher at Mannheim in 1854, and was qualified as privat-docent in the theological faculty at Heidelberg in 1858. He was appointed an ordinary professor here in 1861, at Halle in 1862, and ordinary professor at the latter in 1866. He died April 5, 1888. Of his numerous books most important are: Der Lehrbegriff des Hebrerbriefs (1858-59); 2d ed. 1867; Die Messianischen Weissagungen (1875); 2d ed. 1886; Eng. trans. 1890); Der Begriff der Sühne im Alten Testament (1877); and the posthumous Alttestamentliche-Theologie (ed. by A. Brandt, 1880) and All Testament (ed. by A. Brandt, 2 vols. 1889-90). He edited the second edition of Hupfeld's Commentary on the Paulinas (4 vols. 1867-71) and the invaluable Handwörterbuch des biblischen Altenthums (1884), and was from 1863 joint-editor of the quarterly Theologische Studien und Kritiken.

Riel, Louis, a Canadian insurgent, born in Manitoba in 1844, became a leader of the Metis, or French half-breeds, and headed the Red River rebellion in 1869-70, afterwards escaping from the country. By abducting him he again established a rival government in Manitoba, and in September, when the rising having been quelled, he was executed at Regina.

Rienzi, Colla di, the famous Roman tribune, was born at Rome in 1313. His parentage was humble; his father being a tavern-keeper named Lorenzo. But when the family name of Gabrini is sometimes added. The son, Nicolas (shortened into Cola) studied grammar and rhetoric, read and re-read the Latin historians, philosophers, and poets (Greek was scarcely yet known in Italy), and excited his imagination, while at the same time he coloured his speech, with the prophetic enthusiasm of the inspired writers. The assassination of his brother by a Roman noble, whom he found it impossible to bring to punishment, finally determined him to deliver the city from the barbarous thraldom of the barons. Having found the Guelph party spokesman of a deputation sent to the papal court at Avignon by the commencement of Clement VI., to return to Rome in order to protect the citizens from the tyranny of their noble oppressors. Here he obtained a favourable hearing from the pope, who appointed him to the civic chamber. In April 1344 Rienzi returned home, and sought to obtain the countenance of the magistrates in his ideas of reform, but reform found it impossible without revolution; and for three years he loudly and openly menaced the nobles. At last, when they could rely on the support of the citizens, he summoned them together on the 28th of May 1347, and, surrounded by 100 horsemen and the papal legate, he delivered a magnificent discourse, and proposed a series of laws for the better government of the community, which were unanimously approved. The aristocratic senators were driven out of the city, and Rienzi, as tribune of the holy Roman republic, was invested with practically dictatorial power. The pope confirmed the eloquent dictator in his authority; all Italy rejoiced in his success, and foreseen him as the future of Italy, even while respecting to his enthusiastic friend and admirer, Petrarch), began to dread the reviving majesty of the Eternal City. A bright dream flashed across Rienzi's imagination, the dream of every great Italian from Dante to Mazzini,—the unity of Italy and the supremacy of Rome! Rienzi despatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on the 1st of August 1347, 200 deputies assembled in the Lateran Church. Rienzi was crowned tribune with great ceremony on the 15th April. But the nobles were still bitterly hostile; Rienzi, who defeated them in a bloody battle on the 20th November, became suddenly infected with the insouciance of victory and power, and proceeded to levy taxes and enforce obedience. The papal authority was turned against him; after a short reign of seven months he lost heart at the combination of forces against him, and fled to Naples.

After two years of religious meditation among the mountains of the Abruzzi, Rienzi resumed his life as political reformer, and went to Prague to secure the support of the emperor, Charles IV. Charles, however, sent him as a prisoner to Pope Clement VI. to Avignon, but by the mediation of Petrarch he was released from imprisonment. A new pope,
RIFLES

RIFLE-BIRD (Ptilorhis paradisaea) often spoken of as one of the 'Birds of Paradise,' is perhaps the best-known species of a genus which, according to Elliot, comprises four species confined to Australia and to New Guinea. Ptilorhis paradisaea inhabits the south-eastern districts of Australia, and is found only in very thick 'bush.' The male is regarded as more splendid in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female, as is often the case, is much duller coloured than her mate. See HONEY-EATER.

RIFLES. A weapon, whether cannon or small-arm, whose bore is grooved with spiral channels for the purpose of causing the projectile, when fired, to rotate round its axis, and thus to impart steadiness to it in its passage or flight through the air. The subject of rifled cannon has already been dealt with under the head of Cannon (q.v.); in this article, therefore, it is intended to deal only with the question of rifles as applied to small-arms, whether military or sporting. The idea of imparting steadiness to the projectile and thereby increasing the accuracy of fire is one which has exercised the minds of scientific-artillers and gunsmiths from a very early period in the history of firearms. The cause of inaccuracy when firing a spherical ball from a smooth-bore firearm may be briefly explained as follows: in all muzzle-loading arms the projectile must be smaller in diameter than the bore of the gun, otherwise it could not enter and be rammed home from the muzzle; the projectile therefore rests on the bottom of the barrel, and its centre is below the axis of the bore. When the gun is fired part of the gas generated by the explosion of the powder escapes over the top of the ball, causing a downward pressure on it; as this pressure is removed during its passage down the barrel the ball impinges on the top side of the barrel, and so on, up and down and from side to side, until it leaves the muzzle of the gun; the direction of its flight is therefore not in line with the axis of the bore; the ball is, in fact, set in rapid and violent movement against the side of the barrel. To overcome this inaccuracy the idea suggested itself to cut grooves in the bore of the barrel which by gripping the ball would cause it to rotate round its axis and to leave the barrel more nearly in line with the axis of the bore.

The first authenticated instance we have of a rifled small-arm being actually used was in the year 1563, when the Swiss government issued an edict to the following effect: 'For the last few
years the art of cutting grooves in the chamber of the guns has been introduced with the object of increasing the accuracy of fire; the disadvantage resulting therefrom to the common marksmen has been soon discarded amongst them. In ordinary shooting matches marksmen are therefore forbidden under a penalty to provide with smooth-bore arms. Every one is nevertheless permitted to ride his military weapon and to compete with marksmen armed with similar weapons for special prizes.

In the latter half of the 16th century Augustus Kutter of Nuremberg brought out a rifle the grooves of which were cut with the idea of thin form of rifling. In 1602 a cleric, the Bishop of Munster, invented elongated projectiles for use in such arms, but whether in conjunction with a rifled arm or simply with the idea of improving the accuracy of a smooth bore is not known. In 1729 Lautmann, a Russian, brought out a pamphlet advocating the advantage of firing with balls of an elliptical form with a cavity at the base so as to augment considerably the impetus imparted to the projectile when fired from a rifled arm. Lautmann undoubtedly hit upon the true theory, and had his idea put to practice by the Russian government in the 1730s. The armies of Europe in would in all probability have been armed with rifles a hundred years sooner than they actually were. But Lautmann, like so many other inventors, was in advance of his age and did not live to see the correctness of his theory vindicated.

In 1750 Wild brought out a rifle with six grooves having one turn in the length of the barrel, from which he fired balls weighing eighteen to the pound, wrapped in an envelope of greased linen, the object of the linen being to fill up the bore and to prevent the entry of any powder into the barrel; but nothing came of his invention. And again in 1770 experiments, which were not successful, were made at Metz with elongated bullets.

The adoption of rifles into the British service dates from about the year 1800, when the old 93th Regiment, which later became the Rifle Brigade, were named with 'Baker's rifles,' so called from the name of the inventor. There were two patterns of this arm, one with eleven and the other with seven grooves, the twist of rifling being one turn in 130 inches. The weight of the rifle was 8 lb. 9 oz. and the barrel 99 inches long. The barrel was 2 feet 6 inches, and bore 705". The barrel was spherical; before being rammed home it was wrapped in a greased patch, there being a cavity in the butt for carrying these patches. After firing a few rounds the barrel became so foul that it was difficult to ram the bullets home; a wooden mallet was therefore served out with each rifle to drive the ball down the barrel. This rifle remained in the British service till about the year 1835, when it was superseded by the Brunswick rifle, the invention of Major Berthier in the Brunswick army, which with new two grooves having one turn in the length of the barrel; the bullet, which was spherical, was 'belted'—the belt fitting into the grooves in the barrel—this method being adopted to give the bullet a spin. A grease patch was also used with this rifle; it added greatly to the difficulty of loading, as it made it extremely difficult to see whether the bolt on the barrel was properly placed in the grooves or not. This rifle was the first arm in the British service which had a percussion-lock, and it was not till the year 1842 that a percussion-musket was adopted for service. A rifle with a similar design was about the same time adopted in Russia and in some of the German principalities.

In 1837 a rifled arm was adopted in France for the use of the 'Chasseurs' or rifle regiments. This arm was rifled in the chamber on a system invented by Captain Delvigine of the French army. The diameter of the chamber was slightly smaller than the calibre of the bore; the ball was driven into the rifling, but not sufficiently far to crush the powder. In 1841 the Prussians discarded their old muzzle-loading smooth-bore musket, and introduced in its place another kind of rifle, the having of the rifled barrel, was also made to load at the breech, and in a few years the whole Prussian army was armed with the celebrated 'Zündnadelgewehr' or needle-gun. This arm, the invention of Dreyse (q.v.), is a bolt-gun, the needle being contained in the bolt. It was in form indistinguishable from the having of the bolt to release it from its fastening, then draw back the bolt and insert the cartridge, close the bolt and lock it by turning the handle down to the right. The act of closing the bolt compresses the mainspring and holds back the needle, which is released in the usual way on pulling the trigger. The cartridge is a peculiar one. There is a paper-naché plég called 'Zündspiegel,' in which is imbedded the bullet in the form of an egg. The percussion-cap is fixed in the rear of the plug; behind the plug is the powder charge. The powder, the plug, and the plug hole is crammed in a cartridge-case, which is tied in front of the bullet. On firing the gun the needle presses through the powder charge and strikes the cap in the plug so that the charge is ignited from the front, the idea being that by this means the bullet is less likely to be detached from its bed in the paper-naché pig, which latter takes the rifling and imports rotation to the projectile, the diameter of which is .54 of an inch, whereas the calibre of the barrel is .61 of an inch.

During some experiments at Spandau in 1846 so many needles were broken that the continuation of the arm in the service was in great jeopardy; but its efficacy in quelling disturbances in the troublous times in 1848 and 1849 was so great that in the year 1850 a further large number of arms was made, and the system was further extended by the introduction of carbines on the same model. In 1842 the Austrians armed their rifle regiments with a rifle. Thus we see that by the year 1842 all the great powers of Europe had armed a part of their troops with rifles, and that by 1846 the whole of the Prussian army was not only so armed, but the length of the barrel was increased; thus the superiority over all others of being breech-loaders.

Another point in which the Prussians had a superiority over other nations was that they had a complete cartridge combining in one case the projectile, the powder charge, and the percussion-cap—the introduction of a breech-loader enabling them to have a capped cartridge instead of having to place a cap on the nipple for each discharge. Those who are old enough to remember the old percussion-lock with the capping and uncappping of the nipple will appreciate the immense advantage that was gained by the introduction of the breech-loader.

The vast superiority of the Prussian needle-gun over the rifles in use in other countries gave a great impetus to the spirit of invention, and in 1849 Captain Minié (q.v.), of the French army, brought out a rifle called the Minié rifle; this arm was first introduced into the French, and subsequently, about 1851, into the English army. Up to this date rifles were only issued to rifle regiments, but with the introduction of the Minié rifle it was intended to discard the smooth-bore altogether and to arm the whole army with rifles. The adoption of the breech-loader on a larger scale was the advance; it was the first time the spherical bullet was discarded in favour of one of a conical-conoidal form. The bullet had a hollow base in which was placed an iron cup; on the explosion of the powder this cup forced the bullet into the grooves.
of the rifling. The separate grease patch was discontinued, lubrication being obtained by greasing the paper in which the bullet was wrapped with a mixture of tallow and beeswax. The rifle weighed 9 lb. 13 oz.; its length was 4 feet 7 inches. The breech weight was 1 lb. 15 oz. and was 1½ inches long; the diameter of the bore was .702", the number of grooves three, having a twist of one turn in 38 inches. The charge of powder was 2½ drams, or nearly 70 grains, and the weight of the bullet was 680 grains. The rifle was sighted to 1000 yards. A description has been given in some detail for the sake of comparison with the rifles of the present day. All the English infantry regiments which proceeded to the Crimea armed in the first instance with this rifle, and a large proportion of the French army also had a rifle constructed on the same principle, ranging in detail from the English pattern. This gave the allies an immense advantage over their Russian adversaries, who were still, with few exceptions, armed with the old smooth-bore.

The Snider rifle was cumbersome and heavy, and as early as 1852 experiments were made with a view of obtaining a better weapon. The result of these experiments led to the introduction of the Enfield Rifle, Pattern 1853, so called from the Royal Small-arms Factory at Enfield, Leek, of which factory the rifle was first introduced. The principal point of difference between this arm and the Minie was the great reduction in the diameter of the bore from .702" to .577". This reduction of the bore enabled the barrel to be made very much lighter without in any way impairing the arm as a shooting weapon, in fact it shot very much better, as the bullet was better proportioned. And, while the powder charge remained the same, the bullet was reduced in weight from 680 to 556 grains; by this means the initial velocity was greatly increased and the height of trajectory diminished at all ranges. The lubrication of the barrel was the same as in the Minie. There were two descriptions of this rifle, the long and the short; the long was issued to the regiments of the line, and the short to rifle and light infantry. A carbine was also constructed on the same principle for issue to the cavalry and Royal Artillery. The issue of this rifle and ammunition to the native troops in India was the occasion of the Indian Mutiny of 1857, it being believed that the grease round the bullets was occasionally spread on the food by accident to deleterious Hindoos and Mohammedans alike.

But while the armies of Europe, with the exception of the Prussians, were all armed with a muzzle-loading rifle more or less on the principle of the Minie, experiments were being continually carried on with the view of obtaining a good breech-loader. It was not, however, till the Danish war of 1864 that the very vast superiority of the breech over the muzzle-loader was brought prominently home to the authorities. The need was urgent, but in order to give time to discover a really satisfactory breech-loading rifle it was determined in the instance to convert the Enfield into a breech-loader by attaching the Snider breech-action to the Enfield barrel. The old arms were readily converted, and a large number of new arms were made cheaply, so that by the winter of 1865 the Franco-Prussian war the whole English army was armed with the Snider breech-loader, and during the winter of 1871-72 the militia and volunteers also received these arms; but it was perfectly well understood that the introduction of the Snider breech-loader was only intended to fill the gap until a more perfect and more efficient weapon could be devised; and after an almost exhaustive series of trials, which had been conducted for some time by a special committee appointed for the purpose, the Martini-Henry rifle was in the year 1871 recommended for adoption in the English army.

The manufacture commenced shortly afterwards, and the first issue of rifles of this pattern to the troops was made in 1872. The Martini breech-action has already been described under the head of Breech-loading (q.v.). The barrel was the invention of Mr Alexander Henry, a gunmaker of Edinburgh. The calibre is .45", and the form of the rifling is peculiar. Fig. 1 represents an end section of a barrel rifled on this system. There are seven grooves, having a complete turn in 22 inches, cut in the barrel, forming seven plain surfaces at AA. These are tangential to the periphery of the projectile which is represented by the dotted circle C. In addition to the bearing surfaces thus obtained there are seven angular projections, BB, extending inwards from the ends of the grooves on plain A. Thus in its passage down the bore the bullet has fourteen bearing surfaces at AA...BB, and it expands into the spaces left between A and B, and thus obtains its rotatory motion. Whilst these transformations were going on in England the French had adopted the Chassepot rifle in 1866, superseded in 1874 by the Gras; the Germans in 1871 discarded the needle-gun and adopted the Mauser (see BREECH-LOADING); the Austrians after their war with Prussia in 1866 adopted in 1868 the Wurrdr rifle; the Italians adopted the Vetterli in 1871; the Russians adopted the Berdan rifled muskets in 1871; the British in 1871 by Mark II. of the same rifle; the Americans adopted the Springfield, whilst the minor states adopted breech-loaders of various designs and patterns. It is unnecessary in this article to give a full description of all these rifles, most of them having the bolt breech-action, a drawing of which may be seen under the head of Breech-loading (q.v.), and the tables at the end of the article give all essential particulars in connection with the more important arms.

At the time of its introduction the Martini-Henry rifle was probably the finest military rifle in Europe; it is extremely accurate either at long or short ranges; its bullet has great penetrative power. The rifle is simple and does not easily get out of order. But, while the Martini-Henry rifle was more accurate at all ranges and had a higher terminal velocity and lower trajectories at long ranges than the rifles of the continental armies, these rifles had a higher muzzle velocity and lower trajectory up to ranges of 300 yards. This was due to two causes: either the proportion of powder to bullet was greater in the foreign than in the English cartridge; and secondly, because the value of $\frac{DP}{W}$ was also greater—this being the
mathematical expression used in England to denote the power of the air to retard bullets in their flight, where \( D \) is the diameter of the bullet in inches and \( W \) its weight in pounds; therefore the smaller the value of the fraction the less power has the air to retard the flight of the bullet, and \( \text{vice versa} \). The larger the area in proportion to its diameter, the better able it will be to maintain its velocity at long ranges. It was determined to endeavour to remedy the defect referred to above, so that the English rifle should be superior to all others in all particulars at all ranges. To do this it was necessary to maintain the low value of \( D^2 \) and to increase the proportion of powder to bullet; this led to the introduction of the Enfield-Martini rifle, in which the Martini action was maintained, but the calibre of the barrel was reduced to 40". Owing to the high muzzle velocity obtained—viz. 1570 feet—the trajectory was very flat and the shooting exceedingly accurate. Several thousands of these arms were made, but before they were issued to the troops a far more important change was determined on—viz. the introduction of a magazine rifle. A magazine rifle makes one or more cartridges attached to a magazine or case or hopper containing four or more cartridges which are fed one by one into the barrel by mechanism in connection with and actuated by the breech-action; and the primary object of a magazine arm is to enable the soldier at a critical moment to fire a certain number of consecutive shots without having to reload from the pouch.

The great importance of a magazine arm was first practically demonstrated in the American war between the North and South in 1861, when one regiment of the northern army, armed with a magazine rifle, successfully resisted the attack of a force at least three times as numerous armed with the ordinary single loader, simply on account of the great rapidity of fire. And again in the war between Turkey and Russia in 1877 the constant repulse of the Russian assaults on the Turkish lines before Plevna was in a great measure, if not mainly, due to the fact that the Turks were armed with the Winchester repeating rifle, which enabled them to mow down the Russians by hundreds as they crossed the open to the assault. In the United States System of repeating arms several systems already in practical use, and after the experience of the Turkish war the question was seriously taken up by most of the European governments. By the end of the year 1879 the French government had adopted the Kropatschek magazine rifle for the navy; the Germans were experimenting with a Mauser rifle converted to take the Lee magazine; the Austrians were experimenting with the Kropatschek and the Spitalski; in Italy the Bertoldo rifle had been issued to some few regiments for trial; in Switzerland the army had adopted the Vetterli repeater; and in Norway and Sweden a repeater on the German principle was on trial. The matter was then taken up by the English government, and a committee was appointed by the War Office to consider the whole question. Although the number of arms is in itself a magazine itself, there being a few principal systems or types, which may for convenience be divided under the following heads: (1) Those with the magazine in the fore end of the stock under the barrel; (2) those with the magazine at the breech-action; (3) those with the magazine above and at the side of the breech-action; (4) those with the magazine in the butt of the stock; (5) those with the magazine in a circular form round the breech-action.

**Type No. 1** may be described briefly as follows: The magazine consists of a metal tube fixed in the fore end of the stock, and capable of containing eight or more cartridges. The tube or magazine is loaded by drawing back the bolt of the breech-action and inserting the cartridges one by one into the tube, until the breech end, and the bolt is then pressed against the bullet of the one next behind it. The action of unlocking and drawing back the bolt withdraws one cartridge at a time from the magazine, and places it in front of the bolt; and the action of closing the bolt forces the cartridge into the barrel. As each cartridge is thus withdrawn for loading, the column of cartridges within the tube is pressed back as already described, leaving another cartridge in position to be withdrawn for loading. There is generally a stop or ‘cut-off’ which, when applied, prevents the bolt from acting on the magazine so that the arm may be used as a single loader on occasions when it may not be considered either necessary or desirable to bring the magazine into play.

In Type No. 2 the magazine can either be detachable and carried in the soldier’s pouch, or be attached to the rifle when required for use, or it can be a fixture on the arm itself. In either case the magazine consists of a metal box containing from six to ten cartridges, according to the size of the cartridge. The cartridges, which are inserted at the top of the box or on the arm, compress a spring in the magazine which is generally either in form of a cylinder or in the form of a C. In this type of magazine the cartridges lie on the top of one another, and not bullet to base as described in No. 1 type. They are held in the magazine by a catch or ‘cut-off’, and when this is applied the rifle can be used as a single loader. On withdrawing the cut-off and drawing back the bolt, the spring in the magazine forces one cartridge up in front of the bolt, which, on being pushed home, forces the cartridge into the barrel. By a mechanical contrivance, only one cartridge at a time can be forced up out of the magazine.

In Type No. 3 the magazine can also be either detachable or a fixture on the rifle. In magazines of this type no spring is necessary to force the cartridge out of the magazine, which is loaded by dropping the cartridge in at the top. At the bottom of the magazine, on the side next the body of the rifle, there is a slot, with a corresponding slot in the body or shoe of the breech-action. On drawing back the bolt one cartridge passes out of the magazine through these slots into the shoe, and just in front of the bolt, by the action of gravity alone. The cartridge is then forced into the barrel by the action of closing the bolt. There is also a cut-off with magazines of this type to prevent cartridges passing through the slots when it is not required to use the magazine.

In No. 4 type various attempts have been made from time to time to utilise the butt of the stock by hollowing it out and converting it into a magazine. In this system the cartridges are brought up one by one into the loading position by a ratchet actuated by the bolt. As the bolt is drawn back the ratchet performs forced back, and remaining on to a cartridge brings it forward as the bolt is pushed home again. In Type No. 5 the cartridges are contained in a cylinder placed around the breech-action of the rifle. A spring acts on these cartridges and brings
RIFLES

them up one by one in front of the bolt, the act of closing forcing the cartridge into the barrel. There are objections to the two types Nos. 4 and 5 which have prevented the adoption by any government of a magazine arm constructed on these systems; it is unnecessary therefore to describe them further. Of the arms previously referred to as being under trial by various European governments at the close of the year 1879 the Kropatschek is an example of type No. 1, the Lee magazine of type No. 2, the Jarmann of type No. 3. There is no example of type No. 4, but the Spitzalk is an example of type No. 5.

The Germans were the first to re-arm the whole of their infantry with a magazine rifle; but, pending the result of trials which were being carried on with small-bore rifles and smokeless powder, they determined to disc the first instance to convert the then existing Mauser rifle into a magazine arm, as this would require no change of ammunition, the magazine being placed in the fore end of the stock as described under the head of No. 1 type. But it was generally understood that in order to derive the full benefit from a magazine arm the soldier would have to carry more ammunition, and, as it was not desirable to add to the weight of his equipment, this could only be done by reducing the weight of the cartridge.

A reduction of bore, therefore, became almost a sine qua non, as by that means only could a sensible reduction be made in the weight of the bullet and with it of the cartridge. But this led to fresh difficulties. It is quite impossible in the space available for this article to discuss fully all the difficulties which had to be overcome either as regards cartridge-case, bullet, powder, rifling, &c.; but it may be stated that it was generally conceded that the ordinary charge of loose black powder could not be used in a rifle with a bore less than an inch on account of the difficulty of overcoming the fouling which would take place in a small bore, and also on account of the difficulty of making a suitable cartridge-case. Therefore the question of the explosive to be used had to be considered in connection with the question of the reduction of the bore. The Swiss were the first to arrive at a practical solution of the difficulty. Two rifles were brought out in Switzerland very similar to one another, and merely differing in points of minor details. One was the Rubin rifle, having a caliber of 295 inches. The powder charge consisted of 76 grains of black powder compressed into a solid pellet, and the weight of the bullet, which was nickel coated, was 217 grains. The force of the powder was very greatly increased by compression, and, the proportion of powder to pellet being very high, a muzzle velocity was obtained of no less than about 1850 feet; and the value of being 2.8 the velocity

Experiments were carried on in England with both these rifles, and the results were such as to warrant the committee, which had been investigating the subject, to recommend in the year 1877 the adoption of a magazine rifle for the English army, of which the following is a brief description. The barrel is rigid in the Metford principle (fig. 2, C), in which there are no corners nor angles to hold the fouling. The twist of the rifling is one turn in 10 inches, the bore of the barrel is 0.332 inch, and its length 50-20 inches.

The bolt breech-action which has been adopted for the rifle is a modified form of the Lee bolt. The Lee magazine (fig. 2, D, E), as first adopted (Mark I.), holds eight cartridges, and is detachable—the i.e. it can be carried on the arm itself or in the soldier's pouch; its position on the arm is immediately in front of the trigger-guard underneath the body of the breech-action, in which a slot or opening is cut through which the cartridges are fed up by a spring ready to be pushed into the barrel by the closing of the bolt. There are two turned-in lips (fig. 2, D) at the mouth of the magazine under which the heads of the cartridges are inserted when filling it; the rim of the cartridge projecting sufficiently to be caught by the bolt. These lips prevent the cartridges from being shot out by the

spring, and hold the head down till the bullet has entered the chamber of the barrel. A cut-off is provided to enable the arm to be used as a single loader; this is a plate pivoted at one end, and it is pulled out by means of a thumb-piece projecting on the right side. When it is thus pulled out the magazine is in action, but when pushed in the plate partly covers up the aperture through which the cartridges pass out of the magazine, and forms a bed on which to place the cartridges by hand. The magazine, which fits into a slot cut in the stock under the opening in the body, is held in position by a catch. This can be withdrawn by a small trigger in front of the main trigger, when the magazine is released. The magazine can only be filled by one cartridge at a time; those can be passed into it through the slot in the body of the breech if it is desired to fill the magazine when attached to the rifle. The spring (fig. 2, F) forced forces the cartridge up in the form of a coil flattened at the side. The rifle has two sets of sights, the ordinary back sight (fig. 2, Aa) being graduated to 1900 yards; but for longer ranges there is a pair of sights consisting of a dial sight (fig. 2, Bb) on the left side of the fore end of the stock, and a short arm (fig. 2, Bc) near the trigger, at the end of which is a small hole. The weight of the rifle is 9 lb. 6 oz., and length 49.5 inches. The

bayonet, weighing 15 oz., is in the form of a short knife having a blade 12 inches long. The cartridge (fig. 2, G) for this rifle consists of a solid drawn brass cartridge-case, in which is inserted a pellet of 70 grains of compressed fine-grain powder. After insertion of the powder pellet the case is necked so as to reduce the diameter at the mouth of the case to 312 inches. The latest pattern of Lee-Metford rifle (Mark II.), issued in 1898, has various modifications, the principal being that the magazine holds ten cartridges instead of eight, and black powder is superseded by cordite.

The smallness of the bore necessitated a long bullet, in order to get the necessary weight, and a quick twist in the rifling; it was found that an ordinary hardened lead bullet could not stand the strain, and therefore the bullet, which weighs 215 grains, is composed of a hardened lead core inserted into an envelope of cupro-nickel turned over at the end to prevent the gas on the explosion of the pellet getting up between the envelope and lead core. The length of the bullet is 3.65 inches, and diameter 312 inch. It is pressed into the mouth of the cartridge-case, which holds it firmly. A packet of ten of these cartridges weighs 10 ounces. The muzzle velocity obtained with the powder pellets is 1380 ft.-seconds; but with the cordite powder about 2000 ft.-seconds. When firing at 900 yards' range the highest point of the trajectory above the line of sight is 5 feet, whereas that of the Enfield-Martini 40-bore rifle is 6 feet, and of the Martini-Henry 45-bore rifle 8 feet 7 inches.

But the English government was not the first to adopt a small-bore magazine rifle for the general armament of the whole army, the French having adopted the Lebel rifle as early as the year 1897. It has been already stated that the French navy had for some time previously been armed with the Kropatschek repeating rifle, having the magazine in the fore end of the stock; and, like the Germans, the French had converted their single loading Gras rifle into a repeater on the Kropatschek model. The Lebel is an improved Gras repeating rifle; the bore of the barrel is 315 inch. The magazine (fig. 3) is in the fore end of the stock, and holds eight cartridges. The points of the bullets are flattened to lessen the chance of accidental explosions in the tube, which might be caused by the cap of one cartridge resting on the point of the bullet of the cartridge in rear of it. The cartridge-case is charged with about 35 grains of smokeless powder, and the bullet weighs about 215 grains. The muzzle velocity is about 2000 ft.-seconds. Great results were expected from this rifle when first introduced; but experience has shown that the smokeless powder adopted for the Lebel cartridge is not reliable, and that after being kept a year or so it greatly deteriorates.

The Lebel rifle itself has proved inferior to one of a simpler construction, called the Berthier rifle after the name of the inventor. The breech mechanism is on the same principle as that of all other magazine arms—viz. the bolt containing the striking apparatus; but the magazine in the fore end of the stock is discarded, and the Mannlicher magazine adopted in its place. This consists of a light metal frame or clip holding five cartridges; the clip is dropped into a receptacle to hold it, but cannot drop through, as the bottom cartridge rests on a spring which forces the cartridges up, as in the case of the Lee magazine, and the clip is held up by the top cartridge, which presses against the turned-in sides of the clip. As soon as the last cartridge is fed into the barrel by the bolt there is nothing to hold up the clip, which then drops out, and on the withdrawal of the bolt another clip full of cartridges is inserted. There is a cut-off which enables the rifle to be used as a single loader. The bullet weighs 205 grains, and consists of a hardened lead core coated with a white metal envelope. The charge is 33 grains of smokeless powder. Ten cartridges weigh about 87 oz. The bore of the barrel is 301", and weight of arms 13½ lb. The muzzle velocity is 2070 ft.-seconds. The extreme simplicity in the mechanism of the bolt of this rifle is one of its chief recommendations. In Germany the original Mauser rifle, which had been converted into a magazine arm as a temporary measure, as already described, was, in 1888, superseded by one also the invention of Mauser, having a barrel with a bore of 315 inch, and in which the magazine is filled from a metal clip containing five cartridges, somewhat like the Mannlicher; but the clip or cartridge-holder does not itself pass into the receptacle made in the barrel, as in the Mannlicher; but, being held over the receptacle or magazine, the cartridges are pushed out of it by the thumb, and the clip itself falls off. The magazine rifles of other nations are all modifications of one or other of those already described; but there is a peculiarity in the construction of the Mauser and Mannlicher rifles which must be mentioned. This peculiarity consists in the barrel proper being encased in a barrel jacket or light steel cylinder, both being screwed into the body of the breech, and the use end of the barrel passing loosely through a thimble at the end of the barrel jacket. The sights are fixed to the barrel jacket. There is a very slight air-space between the barrel and the jacket, and the advantages claimed for the compound barrel are chiefly that the barrel proper is protected and is less liable to injury from a blow, and that the outer coating does not heat so rapidly as a barrel constructed in the ordinary way, and that therefore a handguard, such as is used with the English rifle, is not necessary. The Mannlicher and the Mauser both have a calibre of '315', and fire a bullet weighing 216 grains, the charge of smokeless powder being about 35 grains, and the muzzle velocity about 2000 ft.-seconds. In the hands of the Chilian Congressionalists the Mannlicher rifle contributed very largely to the defeat of Balmaceda in 1891.

velocity and great accuracy are required at moderately long ranges; it is therefore necessary to have a heavy bullet in proportion to its diameter. But in sporting rifles long range shooting is not required; the bullet can therefore be made very much lighter in proportion to its diameter. The charge of powder for the Martini-Henry cartridge is 85 grains, and weight of bullet 480 grains—proportion of powder to bullet, 1 to 5½; muzzle velocity, 1,320 ft. seconds; highest point of trajectory at 100 yards, 2½ inches; at 150 yards, nearly 7 inches. In the 450 Express the powder charge is 120 grains; weight of bullet, 260 grains; proportion of powder to bullet, 1 to 2½; muzzle velocity, over 2,000 ft. seconds; highest point of trajectory at 100 yards, 14 inch; at 150 yards, under 3 inches. In the year 1891 the troops of the countries enumerated below have been armed or re-armed with magazine rifles, and since then the United States, Norway and Sweden, and Russia have been supplied with small-bore arms. In the United States army the Krag-Jørgensen rifle (caliber .30) was adopted in 1892, and is in use by the regular army. But during the Spanish-American war (1898) the volunteer troops generally retained the Springfield.

For a more detailed account of the arms referred to in above article the reader is referred to "Armes à feu portatives," by Schmidt, in "Engineering," Nov. of February 6, March 6, April 3, and May 15, 1891, and "Treatise on Military Small-arms and Ammunition," by Lieut.-colonel Bond, R.A. See also the articles in this work on PANG-AMS, GUN, GUNNERY, PROJECTILES, VOLUNTEERS, &c.

Riflemen. All British infantry are now riflemen; but till 1854 rifles were the exception, the army generally having the smooth-bore "Brown Bess." During the Peninsular war the 60th and 95th Regiments armed themselves with long, light infantry drill, and clothed in dark green. The 95th became the "Rifle Brigade." The 60th are called "The King's Royal Rifle Corps." In 1881 the 26th and 90th were linked to form the "Scottish Rifles," and dressed in green; while the 88th and 80th Foot were formed into the "Royal Irish Rifles." See also VOLUNTEERS.

Riga, capital of Livonia, and next after St. Petersburg and Odessa the third seaport of Russia, lies on the Dvina (crossed here by a bridge of boats and a railway bridge) 7 miles from the mouth of the inlet of the Gulf, and 336 by rail SW. of St. Petersburg and Kavkoff. The old town has narrow streets and medieval houses and stores; but the suburbs are laid out in broad streets with handsome buildings. The chief edifices are the cathedral built in 1204, burned down in 1547, but rebuilt; St. Peter Church (1468), with a steeply 400 feet high; the pride of the city, the Knight's Sword, built 1494–1515, the former residence of the grand-master of the order; and several old guild houses and Hanseatic halls. It is the seat of an archbishop of the Greek Church. Its industries are rapidly growing; they turn out cottons, machines, tobacco, corks, spirits, oil, metal wares, glass, paper, flax, jute, and oil-cloth, and employ nearly 12,000 work-people. The exports reach an annual average of £5,560,000 (£2,396,000 in 1866), and embrace grain (average £1,433,000), timber (£1,175,000), flax (£1,077,000), linseed (£381,600), hemp and hemp-seed (£443,600), wool, hides, eggs, oil-cakes, and *pale hardwood*. The imports (iron and steel, coal, machinery, cotton, dye-woods, corkwood, herrings, manure, woolens, and wine) average £2,238,000 (£675,000 in 1866). Britain's share in this trade is represented by an average of £2,604,000 for exports and £2,785,380 for imports. This port, which is closed by ice for three to four months in the winter, is entered by an average of 2,900 vessels of 1,047,915 tons every year, of which 625 of 484,500 tons are British. Riga has grown from 102,698 inhabitants in 1867 to 169,329 in 1881, and 181,885 in 1891. Nearly one half are Germans (with German-speaking Jews), one-fourth Russians, and one-fourth Letts. Riga was founded in 1201 by Albert, Bishop of Livonia, and soon became a first-rate commercial town, and member of the Hanseatic League. It belonged to Poland from 1561, and in 1621 was annexed to Sweden, and in 1710 was finally annexed to Russia.

The GULF OF RIGA is an inlet on the east side of the Baltic Sea, which washes the shores of Courland, Livonia, and Estonia. It is 106 miles in length from north to south, and about 60 in breadth. The bays and inlets of Courland, which open athwart the entrance. The chief river which falls into the gulf is the Dvina. Sandbanks render navigation in some parts dangerous.

Right. See RIGI.

Right Ascension. See ASCENSION (Right).

Right-handedness is no doubt due to the lack of perfect symmetry in the human body. If the latter could be folded over from a medial line so that each organ of the one side fell exactly upon a corresponding organ of the other, the brain and its associated structure highly favourably, mechanically, to the equal use of each limb, and ambidextrous individuals would be the rule, not the exception. If a vertical line be drawn dividing the body it will be found that the centre of gravity is a little to the right of this median line. This unbalanced condition. From a series of experiments the greater weight has been estimated at about 15 ounces. Upon this fact is founded the mechanical theory of right-handedness, or the predominance of the right hand over the left; or, more generally, of the limbs of the right side over those of the left, shifting the centre of gravity farther to that side. In violent muscular exertion there is more air proportionally inhaled by the lung of the side which sustains the exertion. Normally about 230 cubic inches of air are contained by the lungs, of which the right holds 20 inches more than the left. Under exertion of the right side the larger lung is better filled than the smaller, and the centre of gravity is removed until it is found in a line passing through the right foot; so that the right leg and foot afford a steadier basis of support than the left would do under similar circumstances. Which ever leg and foot use the arm of that side to greater advantage, and thus, through the greater use of the right lower limb, the right upper limb comes to be preferred.

Professor Buchanan's theory also explains the almost universal habit of carrying the left arm on the left shoulder. In the case of a light weight, slung on the arm, the equilibrium of the body is better.
RIGHT-HANDEDNESS

maintained by carrying it on the left side. If the weight be a heavy one, borne on the left shoulder, the burden is really being supported very much by the right limb, owing to the natural curve of the body towards the right side, while supporting it on the right shoulder.

But, it may be argued, if this theory covers the case, then left-handedness, which is certainly inherited, cannot be accounted for except on the extraordinary supposition of transference of the viscera. In a very few cases left-handedness has been found to accompany such a transposition. Strange to say the liver has been found on the left side, and the heart, stomach, and spleen on the right without any derangement to the health of the subject, even from the point of view of a life-insurance company. Nevertheless, the number of cases of genuine left-handedness far exceeds such instances of transposition. An explanation of left-handedness in normal structures has been sought by falling back on the fact that the cerebral hemispheres of the brain work the muscles cross-wise. Forer's researches have proved that when we wade with the right eye we see with the left side of the brain. Another curious and instructive fact is that, although an animal be rendered blind of an eye by the destruction of a convolution on one side of the brain, the blindness is temporary. Soon the other hemisphere comes into action, and the animal sees with the right eye.

Viewed in this light, hereditary left-handedness may be due to the greater development of the right side of the brain. Suppose accident, or the emnity of the conqueror, had deprived a comparatively young archer of his right hand or right eye (the latter cruel custom is referred to in the Bible), then the left hand, governed by the right hemisphere, being called into work would react on that hemisphere, whose blood-vessels would be often replenished all whose strength and senses would grow. It is not too much to assume that in some cases this improved power of the right hemisphere might be transmitted to a descendant. It is practically certain, says Dr. Bastian, that the great preponderance of right-handed movements in ordinary life and of folk-tales and superstitions in the complex organisation of the left and the right hemisphere. M. Broca states that in forty brains he examined he found the left frontal lobe heavier than the right. These investigations have not yet been thoroughly carried out; but possibly the explanation of the obstinate left-handedness lies in that direction.

In connection with the evolution of the species right-handedness, in all probability, has been a late acquisition. The body is more symmetrical in early youth, and is more symmetrical in the female than in the male. A very young child betrays no disposition to use the right hand more than the left. The habit of using the right hand gradually increases with boyhood, and boys have to the last a wider range with the right hand than girls, who are proverbially left-handed. M. Hitherto, however, the oldest records of the human race, even when man was hewn with a flint point on the bones of extinct animals, prove him to have been a right-handed being. His profiles are then sketched with faces toward the left, just as a street arab chief does a horse in the meltings. Hence, the primeval left-handed artist only paints himself. Bronze weapons are the weapons of right-handed individuals; witness the curious yewtree handle of a bronze sickle fished up from the lake of Brienne, Switzerland, quite intact and inscribed "Left-handed artist," says Sir Daniel Wilson, "of being used by a left-handed swordsman as our present mower's scythe."

A few observers of the habits of savages have remarked that left-handed individuals were proportionally more numerous among them. This is what we should expect from the enormous additional demands made by civilisation, its manners, and its tools upon the activity of the right hand. It is only required that one should sit at a bench to see how planes, screws, &c., are fashioned to suit that member. In drawing a pattern of small repeating character we begin, as we begin to write a page, at the top left-hand side, so as to avoid placing fingers on the still undried pigments. Military drill, table-laying, and the use of plug tobacco, as any, the tyrannous fashion, all urge on the right hand in the path of greater dexterity, leaving the left as the inept drudge whose duty it is merely to assist. No wonder the right has acquired strength, size, greater tactile sensibility, and greater resistance of the extremes of heat and cold. Naturalists, who observe that adult monkeys catch nuts more with the right hand, that the African elephant digs more with the right task, or that the Carolina parrot has a preferential claw for grasping, tell us that these habits are subject to numerous exceptions. It is the exception of left-handedness with human beings. Egyptian and Assyrian painting and sculpture and Etruscan bronze also elucidate the general law that burdens have been assigned to the left shoulder; so that the position of the shepherd's plaid is nowise a thing ascribed to the hand. In the heavens, the protective blanket-like toga of the Etruscans covers the left shoulder, and is wrapped under the right arm to allow of the freer motion of that arm.

Use and disuse, by strengthening or weakening organs, would warrant us in believing that where there is inequality of vision between one eye the balance would be thrown in favour of the right. As Sir John Herschell has remarked, cases can be adduced of persons who were unaware of one of their eyes being weak almost to blindness until for doing some arduous work in which the left eye was required, the right eye, inherited from a grandfather short-sighted in both, the defect of which he did not discover until far advanced in manhood. It is well to know that such disparity in power of vision can be greatly mitigated by the lenses of the optician. A good deal of the dexterity of the right and left hands. The rule of the road and the interpretation of omens tell, by the contrary rule obtaining in nations of different race, no small part of their story as to whether they belong to the conquerors or the conquered. See Sir Daniel Wilson's "The Brain; its Functions. In "The Right of Way", under Professor Dwight in "Scribner's Magazine" (April 1891); also the article "Brain", Vol. II. pp. 391, 392.

Right, CLAIM OF. See FREE CHURCH.

Right of Way, the right which the public has to the free passage over roads or tracks. The expression is more generally applied to those public routes which are not statutory roads, such as hill or field paths, drove roads, bridle and other paths, and cart or driving roads in the common use of the public, which are not kept up by the county authorities. In many instances these roads are the only means of communication between important districts; and generally they are the shorter, and often the more picturesque, ways from one point to another. Right of way also exists along the seashore for the backs of the banks of New Hampshire. The law of rights of way is judicial and not statutory.

In Scotland, where of late the chief causes célèbres have originated, forty years' continuous use by the public of such roads or paths is the prescriptive period for constituting a right of way; while in England the public house "The Right of Way" under dedication to them by the owner of the soil, and user signifying their acceptance of the same, or when dedication can fairly be assumed from
notorious user, which needs generally to be proved for a lengthened period, but which may yet, according to circumstances, be presumed from a period of user of only a few years. The following paragraph, from a statute passed in 1888, which enacts that county councils 'may, if they think fit, contribute towards the costs of the maintenance, repair, enlargement, and improvement of any highway or public footpath in the county, although the same is not a main road.'

In Scotland and England influential societies exist for the purpose of assisting in the protection of public rights of way—viz. the Scottish Rights of Way and Recreation Society, Edinburgh, founded in 1844 and reconstituted in 1884, and the National Footpath Preservation Society, London, founded in 1894. There are also several societies for special districts. Bills have since 1888 been introduced into the House of Commons by private members with the object of charging a public authority with the duty of protecting and maintaining rights of way, but no legislative measure has yet been passed. See also the article on the law of highways at Roads. For right of way on the Norfolk Broads, see Walter Rye, Fishing, Shooting, and Sailing on the Norfolk Broads (Norwich, 1891).

Rights. Declaration and Bill of. The Convention Parliament which called the Prince and Princess of Orange to the throne of England sat forth. In a way, the law of property, and of course the right of redress, is not the law of highways at Roads. For right of way on the Norfolk Broads, see Walter Rye, Fishing, Shooting, and Sailing on the Norfolk Broads (Norwich, 1891).

RIGIDITY
RING

RIGOR MORTIS

abstract dynamics a rigid system is a collocation of particles which, however much they may move as a whole, never alter their mutual relative positions. Such a system has no true physical existence, since there is no known substance which can nearly do this. Nevertheless there are those substances which yield but slightly to deforming stresses—all solids practically—are regarded as possessing a certain rigidity, which is measured by the ratio of the deforming stress to the deformation produced. The greater this ratio is, the greater the rigidity. This condition is the ideal rigid body, whose behaviour under the action of forces forms the subject-matter of what is usually called Rigid Dynamics. The property of rigidity itself, as described above, fails to be discussed under the general subject of elasticity. Of ordinary substances steel possesses the highest rigidity. See ELASTICITY, ETHIC, MATTER.

Rigor Mortis. See DEATH.

Rigveda. See RELIGION.

Rilke. See THEODOR.

Rimini, a city of Italy, stands on the shore of the Adriatic, 69 miles by sea northeast of Bologna; it is still marked with its ancient walls, and contains many medieval buildings. The cathedral, the temple altered and rebuilt to commemorate the unhallowed love of Sigismundo Malatesta and Isotta degli Atti, a beautiful Renaissance structure, dates from 1440-50; the church of St Giovanni Battista contains many religious pictures. The Romanesque castle of Malatesta is now used as a prison. The little river on which the city stands is spanned by a white marble Roman bridge, 256 feet long, with five arches. Beside one of the gates stands the triumphal arch, 46 feet high, erected in honour of Augustus. The spot where Caesar stood to address his soldiers after crossing the Rubicon (about 10 miles NW. of Rimini) is marked in one of the squares by a monumental pillar. The city manufactures silk and salt. (See POP. 10,638, with suburbs 19,158. One of these suburbs, half a mile distant on the seashore, is much visited for sea-bathing. Originally an Umbrian, and then for several centuries an Etrocan city, Rimini (Arin- inia) fell into the hands of Rome in 264 B.C. They made it the northern terminus of the Flaminian Way from Rome, and the southern terminus of the Emilian Way to Piacenza and of the Popilian Way to Venice, and utilised the advantages of its position as a seaport for communicating with the east side of the Adriatic. After being battled for by Goths and Byzantines, and held by the latter, the Lombards, and the Franks, it became a shuttlecock between the emperor and the pope. At last, weary of this alternation of masters, neither of whom profited her, Rimini put herself under the protection of the House of Malatesta (1287), whose chiefs soon made themselves absolute masters of her fortunes. Amongst the tragic episodes that marked the family history of these rulers may be mentioned the killing of Francesca (q.v.) da Rimini and her lover by her brother, and the murder of John of Byrrhus, the object of Byrrhus's project of Byzantium's conquest. The most famous, or rather infamous, member of the family was Sigismundo (1417-68), a brave and skillful soldier, a scholar, a patron of the fine arts, but a man of brutal animal passions, and with no sense of right and wrong. The head of the house sold his rights over Rimini to the Venetians in 1593; but the pope wrested them to himself in 1598, and kept them until 1860. See Vriate's Un Condottiere au XV. Siecle: Rimini (1882).

Rimouski, a Canadian town, stands on the south shore of the St Lawrence, at the influx of the Rimouski River, 182 miles by rail NE. of Quebec. It is the seat of a bishop, a summer watering-place, and a telegraph station for arrivals and departures of ships. Pop. 1417.

Rinderpest. See CATTLE-PLAGUE.

Ring (Sax. ring or hrung) is any circle or section of a cylinder. Rings of gold, silver, and of other metals and materials have been worn in all times and countries, and while they have been used to decorate the ears, nose, lips, arms, legs, and toes, finger-rings have always occupied the most important and significant place among such ornaments. From the earliest period of civilised relationships the finger-ring was a convenient means for carrying the signet of its wearer. In Genesis, xxxviii. 17, 18, we read that Judah left his signet as a pledge with his daughter-in-law; and in chap. xii. 42 it is narrated that Pharaoh delivered to Joseph his royal signet as a token of deputed power and authority. From the fact that these ancient rings carried engraved signets early ring-lores is intimately mixed up with the origin and development of gem and seal engraving. Heroic tales mention the wearing of finger-rings by the Babylonians, and from Asia the habit probably passed into Greece, although the Homeric poems mention ear-rings alone. In the later Greek legends the ancient heroes are described as wearing rings, and every freeman throughout Greece seems afterwards to have possessed one. The Life of Alexander says that the Romans are said to have derived the use of rings from the Sabines; their rings were at first, as those of the Greeks, signet-rings, but made of iron. Every free Roman had a right to wear one; and down to the close of the republic the iron ring was worn by those who affected the simplicity of old times. Ambassadors, in the early age of the republic, wore gold rings as a part of their official dress—a custom afterwards extended to senators, chief-magistrates, and in later times to the equites, who were said to wear aurei their rings, anulii aurei, from which other persons were excluded. It became customary for the emperors to confer the golden ring on whom they pleased, and the privilege grew gradually more and more extensive, till Justinian embraced within it all citizens of the empire, whether singeni or libertini. Rings entered into the groundwork of many oriental superstitions, as in the legend of Solomon's ring, which, among its many magical virtues, enabled the monarch to triumph over all opponents, and daily to transport himself to the celestial spheres, where he learned the secrets of the universe. The Greeks mention various rings endowed with magic power, as that of Gyges, which rendered him invisible when its stone was turned inwards; and in old Saxon romances a similar ring legend is incorporated. The ring of Polvercates (q.v.), which was flung into the sea to propitiate Nemesis, was found by its owner inside a fish; and there were persons who made lucrative traffic of selling charmed rings, worn for the most part by the lower classes. By many Mussulmans at the present day a ring having enclosed in it a verse from the Koran is worn as an amulet.
Various explanations have been given of the connection of the ring with marriage. It would appear that wedding-rings were worn by the Jews prior to Christian times. Fig. 1 shows a Jewish marriage-ring beautifully wrought in gold filigree, and richly enamelled, now in the possession of Lord Londesborough. It has been said that as the delivery of the signet-ring to any one was a sign of deputing or sharing of authority, so the delivery of a ring by husband to wife indicated her admittance to share his rights and privileges. In pagan times in Europe the ring seems to have been connected with fidelity or with espousals. Fig. 2 shows a form of betrothal-ring called a gimmel, or linked ring, which was used in later times; the upper fig. shows the three parts brought together, the lower fig. the parts separately. By an ancient Norse custom, described in the Eyrbyggia Saga, when an oath was imposed, he by whom it was pledged passed his hand through a silver ring, sacred to that ceremony; and in Iceland the ceremony of betrothal used to be accompanied by the bridegroom passing his four fingers and thumb through a large ring, and in this manner receiving the hand of the bride, as is represented in a woodcut in an old edition of Olaus Magnus. As lately as 1780 the practice existed in Orkney of a man and woman plighting their faith at the Standing Stones of Stenness by joining their hands through the perforated Stone of Odin. For betrothal, as well as for marriage, a ring is commonly bestowed; and in many countries both spouses wear wedding-rings. Although the third finger of the left hand is the official finger, rings are worn on all fingers, and in medieval times even the thumbs were frequently decorated with large and massive rings. During the 16th, 17th, and 18th centuries it was a very common practice to have mottoes inscribed on rings (fig. 3), including wedding-rings, and the motto was called the posy or chummon. The ring was the symbol of the dominion of Venice over the Adriatic; and yearly, on Ascension Day, a ring was thrown by the Doge from the ship Bucentaur into the sea, to denote that as the wife is subject to her husband, so is the Adriatic Sea to the republic of Venice. The reception of a ring forms an essential feature in the investiture of many Catholic dignitaries; and even in the Anglican communion a sapphire 'pontifical' ring was presented in September 1891 to the new Archbishop of York. The 'fisherman's ring,' containing an engraved representation of St. Peter in an ancient fishing-boat, is the official ring of investiture of the pope. It is broken and remade on the death of each pontiff, and when presented to the new head of the church he declares the name under which he desires to rule, which name is thereafter engraved on it. Cardinals on their elevation receive a sapphire ring, and bishops, a gold ring invested with a special ring. The reception of novices into Catholic sisterhoods is accompanied with the presentation of a ring, which is worn as a badge of espousal to the church. In the investiture of sovereigns the ring also occupies an important position in the ceremony. In addition to these, special rings were formerly worn by sergeants-at-law, who also on receiving silk made presents to various functionaries of rings (100 sometimes, costing £55 in all, cf. Notes and Queries, 1884). Moreover, the knightly orders, Masonic bodies, and many individuals employed for enabling them to claim the privileges of their orders or to facilitate their business. The carrying of seals attached to the watch-chain in the first place, and next the introduction of gummed envelopes, have had no small influence in decreasing the official importance of rings.

See the article Gem: Finger-ring Lore, by W. Jones (1877), an elaborate compilation of the practices, superstitions, and traditions connected with rings. See also King's Antique Gems and Rings (1872); History and Poetry of Finger-rings, by C. Edwards (New York, 1880); articles by Waterton, Forthom, and others in Archaeological Journal; and F. Schneider, Die Gestaltung des Ringes vom Mittelalter bis in die Neuzeit (Mainz, 1878).

Ringan. St. See Ninian.

Ringbones. This term is applied to ossuous or bony growths which are found upon the upper and lower pastern bones of the horse. They are of two kinds, true and false. The false ringbone is an exostosis situated above the middle of the long pastern bone, and as a rule gives no inconvenience, and unless very large is not looked upon as an unsoundness. The true ringbones, which are of two kinds—viz. high and low—are always to be considered as constituting an unsoundness of the gravest character, involving the articular ends of the bones, and giving rise to obstilinate and often incurable lamenesses. The high ringbone involves the pastern joint, and the low ringbone the coffin joint, and is partly within the horned foot; in many cases both high and low ringbones are coexistent. Ringbones vary in size, but the degree of lameness does not depend upon the mere size of the new formation. Very often the 'ring' may be a mere segment appearing only upon the side of the limb; in other cases it may completely envelop the whole circumference. As a consequence, ringbones are hereditary, and it is unsafe to breed from an animal having a ringbone.

The treatment should be complete rest, fomentations and poultices at first, and afterwards blistering, firing; and in cases that do not give way to these remedies the 'nerve operation' should be performed.

Ring-dove. See Pigeon.

Ring Money. In early commerce, before the invention of coinage, but after the inconveniences of direct barter became evident, the precious metals in the form of rings and other personal ornaments were used as a medium of exchange. The employment of gold and silver as currency in this form among the early Egyptians is proved by contemporary representations of rings, and the exorbitant price of gold and silver rings, one such picture occurring in the decorations of a rock-grotto associated with the cartouche of Amenophis II. The allusion also in Genesis, xxlii. 21, to the sons of Jacob finding their money 'in full weight' in the mouth of their sacks, may be taken as indicative of such a currency at a time when coinage of
RING OZEL

279

definite weight and value did not exist. A similar currency appears to have been in use among certain western communities at a much later period. A Norse law made about 1290 alludes to an established ring money, of which, however, each ring was of definite weight. It has been suggested that many ancient Celtic ornaments of gold and silver had a definite weight and value to fit them for exchange purposes; but, while it is certain that these objects served both for personal adornment and for purposes of traffic, it has not been proved that they were made to any standard of weight or value. Caesar mentions that in Gaul and Britain gold and silver rings were used as money. Among the modifications of ring money in use in different countries may be mentioned the silver fish-hook money of Ceylon, mentioned by Tavernier, of the form of a flat wire bent into a hook, and issued as late as 1650. At the present day ring money for African traders is regularly manufactured at Birmingham of copper, or an alloy of copper, and is known under the name of ‘Manillas.’

Ring Ozel (Turdus torquatus, or Meraea torquata), a species of thrush, rather larger than a blackbird. It is a native chiefly of the western parts of Europe; it spends the winter in the south of Europe, Northern Africa, Syria, and Persia, and visits more northern regions in summer. It occurs frequently in many parts of the British Islands, where it breeds even in the Orkneys, but in very few districts does it remain all the year round. It is seldom seen in the more cultivated and thickly-peopled districts, preferring mountains, heaths, and their vicinity. It begins to breed in the later part of April, and makes its nest generally in healthy banks, often under a bush.

Ringworm (Tinea tonsurans) is a disease dependent on the presence of a parasitic fungus, known to botanists as the Trichophyton tonsurans, and discovered in 1844 by Malmsten. The fungus consists of a mycelium, or network of threadlike filaments, with oval, transparent spores, about tenth of a millimetre in diameter, for the most part connected in chains, but sometimes isolated. When found on the surface of the body the fungus grows in the epidermis; but on the scalp, where it is most common, it is chiefly seated in the interior of the hair-roots. The diseased hairs lose their elasticity and break when they have risen a line or two above the scalp.

Ringworm of the Body (Tinea circinata; Tinea marginitata) first appears as a rose-coloured and slightly-elevated spot about the size of a threepenny-piece, on which a bran-like desquamation of epidermis soon begins, accompanied by slight itching. This spot gradually increases in size, but retains its circular form; and as it extends, the healing process commences at the centre, so that the circular red patch is converted into a ring, enclosing a portion of healthy skin; and a ring thus formed may continue to expand until it reaches a diameter of four inches, or even more. It is apt to affect the face, the neck, the back, and the outside of the wrist. This form of ringworm frequently terminates spontaneously.

Ringworm of the Scalp (Tinea tonsurans) usually occurs in children, and is especially prevalent when the nutrition is defective, or there is a scrofulous taint in the constitution. In infants, and after the age of puberty, it is rare, and can usually be readily cured. It appears in the form of round, scaly, irritable patches, of different parts of the scalp, and the irritation often occasions the formation of minute vesicles. The hairs at these spots become dry and twisted, and are easily removed, but when the disease advances they break close to the scalp if an attempt is made to extract them. The scabs, and the epidermis surrounding them, become covered with a characteristic grayish-white powder, consisting of the spores of the fungus. The diseased parts are slightly elevated and puffy, and differ from the healthy scalp in colour, being bluish or blackened in different parts of the scalp. The grayish red or yellow in fair patients. The inflammation will last as long as the growth of the fungi continues; and even when they die spontaneously, as sometimes occurs, the affected spots may become bald in consequence of the hair-bulbs becoming atrophied. This condition, however, generally passes off in time. In some children only single hairs here and there may become or remain affected, and such cases are particularly apt to lead to the spread of the disease, because they are difficult to detect, and often escape recognition.

Ringworm is also sometimes met with in the beard, giving rise to one form of the troublesome disease known as Sycosis. Ringworm is extremely contagious; and when a case of it occurs in a family or a school, precautions are necessary to prevent its spreading to others. The greatest care should be taken that no brushes, sponges, towels, caps, &c. touched by the patient are used by others. The hair should be kept short, and the scalp anointed daily with carbolic oil, 1 in 20; a cap of linseed or oilseed should be worn night and day; and whatever remedy is selected should be steadily and perseveringly applied. No child with ringworm should be allowed to go to school, unless under very special precautions, nor to the hatter or hairdresser; and intercourse with other children
should be permitted as little as possible except in the open air.

Treatment.—Ringworm of the body is usually not difficult to cure. The application of soap or ammoniated mercury, or precipitated caustic, solution of sulphurous acid, tincture of iodine, usually quickly kills the parasite and so ends the disease. Ringworm of the scalp, on the other hand, is often an extremely intractable affection, because the parasite extends deep into the hair-follicles, and it is very difficult to bring the remedies employed satisfactorily in contact with it in this situation. In recent cases the remedies recommended above are often effectual; but those which have become chronic sometimes tax the ingenuity of the physician and the patience of the nurse to the utmost, and magnificent years make the soil unfavourable for the further propagation of the parasite.

Ringworm in the lower animals, as in the human subject, consists of the growth of a vegetable fungus on the surface of the skin, is common amongst young animals, is decidedly contagious, and communicated readily to the lower animals, and probably, also, from the lower animals to man. Commencing with a small itchy spot, usually about the head or neck, or root of the tail, it soon spreads, producing numerous scurfy circular bald patches. It is unaccompanied by fever or discharge intermixed with silver foam, with health. After washing with soap and water, run over the spots lightly every day with a pencil of nitrate of silver, or rub in a little of the red ointment of mercury, or some boile of sulphur liniment. See works by A. Smith (3d ed. 1855) and G. thin (1867).

Riobamba. See Cañar. 487.

Río Bravo. See Río Grande.

Río Cuarto, the second city in the Argentine province of Córdoba, formerly called Concepción, occupies an important strategic situation on the river of the same name, 500 miles NW. of Buenos Ayres and 170 mi by r. of S. of Córdoba. Pop. 12,000.

Río de Janeiro, a maritime state of Brazil, lying between Espirito Santo, Minas Geraes, and São Paulo. Area, 20,927 sq. m.; pop. without the municipality of 6,496,000. The province is low and swampy, the interior mountainous and healthy; the chief ranges are the Serras dos Orgãos (3700 feet) and da Mantiqueira in the extreme west (8900). The principal river is the Paraíba. There are still considerable forests, though they have been largely cleared, yielding a famous and highly valued cultural product, and after that sugar and cotton. Sugar-houses, distilleries, breweries, and manufactories of cottons, hats, and cigars are numerous. The state contains iron, kaolin, marble, &c. The capital is Niteróy, on the Bay of Pría Grande; with São Domingo and Pría Grande it has 20,000 inhabitants. The German colonies in the state have a pop. of over 15,000.

Río de Janeiro, the capital of Brazil, stands on the west side of one of the most magnificent natural harbours in the world. An inlet of the Atlantic, the bay of Río de Janeiro runs northwards for some 15 miles, varying in width from 2 miles to 7; it is girdled on all sides by picturesque mountains, covered with tropical vegetation. The entrance, which is less than a mile wide, passes between two bold headlands, on one of which is a steep conical mesa called the Sugar-loaf (1270 feet). The city, which lies on the south-western side of this mesa along the shore, climbing up the numerous irregular summits and dipping into the little green valleys between them, whilst great mountain-ranges (1500 to 3000 feet) shut in the background. About 3 miles SW. of the city stands the precipitous mass of Corcovado (2330 feet), up which a cog railway carries 50,000 visitors every year to enjoy the magnificent view. The streets are mostly narrow and often mean, and the houses and public buildings, though generally quaint and gay with colour, are insufficiently disposed for the general architectural features. Although Río has few magnificent public buildings, it possesses very useful public institutions, as the vast hospital of La Misericordia (1200 patients), the national library (1807), with nearly 150,000 volumes, the national museum (with unique collections), the large botanical asylum (1841) at the suburb of Botafogo, the botanical gardens with a celebrated avenue of palms (beyond Botafogo), the observatory, the Geographical and Historical Institute (1838), the former royal palace at São Christoão, the arsenal, the naval dockyards, and the Casa de Ornithologia, a school of medicine, a ‘Pasteur’ institute, a conservatory of music, a polytechnic school, &c. In spite of a good water-supply, chiefly by an aqueduct (1750) 12 miles long, and a new system of sewage-draining, the city is not very healthy; the surrounding hills shut out the breezes, and the heat grows intense in summer. Yellow fever prevails during the hot season; and the Negro population suffers from smallpox. Pop. (1872) 274,972; (1890) 322,631, including many foreigners—Portuguese, British, French, and Germans.

Río de Janeiro, the capital, sending out 51 per cent. of the total exports of the country, and bringing in 45 per cent. of the imports. The exports average £10,800,000 a year in value, all except about half a million sterling being for coffee; of the total, £5,500,000 go to the United States, more than £1,000,000 to Germany; Great Britain buys £500,000 less than France and Austria. The imports, chiefly cotton, gold and silver, metals, wool, provisions, and machinery, average about £12,700,000 a year. Great Britain supplies 51 millions sterling of this, Uruguay and Argentina are responsible for 34 millions, France close upon 2 millions, and Germany nearly 1½ million. The whole sea-frontage of the city is lined with quays, and in 1889 extensive new harbour-works were begun, embracing a dock of 75 acres, a breakwater 2300 yards long, an elevated railway, etc. (1894), which cost £22,000,000. It has 15 docks every year some 1500 vessels of 1,674,000 tons, about one-third (514,000 tons) British. The city possesses cotton, jute, and silk mills, tobacco and hat factories, machine-shops, tanneries, &c.

On 1st January 1831 a Portuguese captain, Alphonse de Souza, crossed the river-thinking it was the mouth of a large river he called it Río de Janeiro—i.e. January River. The French established themselves on one of its islands (Vileigagomin) in 1555; but they were driven away by the Portuguese in 1567. Río was founded in the preceding year; was plundered by Dugny-Trouin in 1711; supplanted Bahia as the capital of the viceroy in 1763; and in 1822 was made the capital of the empire of Brazil. The revolution of 15th November 1889, which transformed the empire into a republic, centred in Rio; and its bay was the scene of most of the naval fighting in the civil war of 1893-94. The federal district in which the city stands (area, 539 sq. m.; pop. 900,000) is administered directly by the federal authorities.

Río Grande, also Río Grande del Norte, and Río Bravo del Norte, a large river of North America, rises in the Southern Mountains of Colorado, and flows generally south-eastward into the Gulf of Mexico, forming on its way the entire boundary between Texas and Mexico. Its length is about 1800 miles; it is for the most part a shallow stream, but small steamboats can ascend for nearly 500 miles. Its valley is affluent to the Rio Pecos. See also, for other Río Grandes, PARÁNA and SENEGAMBIA.
Rio Grande do Norte, a maritime state of Brazil, occupies the north-east angle of the country, and is bounded on the N. and E. by the Atlantic. Area, 22,193 sq. m.; pop. (1890) 268,273, one-half Indians. It derives its name from the river Rio Grande, which flows into the Atlantic at the eastern part of the state but is not navigable by vessels of war; and the principal river is the Piranhas. The surface is flat along the shores, which are skirted by dangerous shoals and reefs, but is mountainous in the interior. The principal crops are sugar and cotton; large herds of horses and cattle are reared on the extensive pasture lands.

Rio Grande do Sul, the southernmost state of Brazil, is bounded on the N. and W. by the river Uruguay, on the S. by the republic of Uruguay, and on the E. by the Atlantic. Area, 91,310 sq. m.; pop. (1890) 337,435, of whom 100,000 are Germans and 52,000 Italians. The northern portion of the state consists of an elevated plateau, the edges of which are heavily timbered; the southern half is a rolling grassy plain, on which large numbers of cattle are kept. The climate is healthy, well suited for vegetables and the Germans and the Italians have established large and prosperous colonies here. All the cereals and fruits of central Europe can be grown advantageously, and the inhabitants are awakening to the importance of developing the immense agricultural resources of the state. The principal towns are Porto Alegre (q.v.), the capital, and Pelotas.

Along the coast stretch the two lagoons, Dos Patos (174 miles long by 34 wide) and Mirim, connected by a navigable channel. The principal articles of export are beans, horca, beans, tobacco, jerked beef, tallow, and manioc flour, reaching nearly half a million steliers in value. The imports, valued at 14 million pounds sterling, consist of cotton, woolen, and linen manufactures, coal, earthenware, and hardware. The principal towns are Porto Alegre (q.v.), the capital, and Pelotas.

The town of Rio Grande stands on the southern shore of the strait leading into the southern end of the Lago dos Patos. Pop. 18,000. In January 1891 a beginning was made with the work of removing the sand-bar that obstructs the entrance, the intention being to deepen the harbor and even make Rio Grande a great port for southern Brazil.

Rioja, a western province of the Argentine Republic, with an area of 34,365 sq. m. and a pop. of about 80,000. Much of it is desert, but in the west there are very fertile Andes valleys, where wheat, maize, vines, cotton, and tropical fruits are grown. Copper, silver, and gold are mined.—Rioja, the capital, founded in 1591, lies at the foot of the Sierra Velasco, among orange groves and vine-clad hills, 350 miles by rail N.W. of Cordoba. Pop. 6000.

Riom, a town of France (dept. Puy-de-Dôme), is picturequely situated on a hill, 6 miles by rail N. of Clermont-Ferrand. It is a thriving agricultural market, and is a perfect preserve of domestic architecture, especially of the Renaissance period. There is considerable trade, and tobacco, linen, and machinery are manufactured. Pop. (1891) 11,169.

Rion. See PIASES.

Rio Negro. (1) one of the principal affluents of the Amazon River, rises as the Guainia in south-eastern Colombia, and then runs north-west into the Amazonas in Brazil, and then south into Amazonas in Brazil, and then east and south-east until it empties into the Marajo, after a course estimated at 1350 miles. Its chief tributary on the right is the Uaupes; on the left it receives the Casiquiare (q.v.). By means of which connexion it is possible to sail from the Casiquiare and the Amazon, and also the Cabaiburu, Branco, and other streams. It is over a mile broad when its clear, inky-black stream enters the yellow, muddy Amazon. A few miles from its mouth is Manáos (q.v.), on the left bank; and higher up the river opens into great lagoons, nearly choked with numerous islands. See A. R. Wallace's Travels on the Amazon and Rio Negro (1833).—(2) A river of Argentino, which rises in the Anolpe lake of the Neuquen (see Neuquen, N.W. of Santa Fé) and afterwards the Limay, and receives the name of Rio Negro at its junction with the Neuquen, after which it flows east and south-east into the Atlantic Ocean. It is over 500 miles long, and for small steamers is navigable all the way. Near its mouth are large open lagoons, where immense quantities of salt are collected. It flows on the north and gives its name to a national territory, formerly part of Patagonia, and now containing an area of 81,895 sq. m. of for the greater part level but barren soil. The chief town is Viuela (pop. 1500), 20 miles from the mouth of the Rio Negro.

Rionegro, a town of Colombia, in Antioquia, some 15 miles S.E. of Medellin. It was founded in 1545, and the National Convention met here in 1863. Pop. 9000.

Rionero, a town of Southern Italy, 12 miles N. of Potenza; it suffered greatly from earthquake in 1881. Pop. 1,150.

Riot consists in the joint unlawful action, by breach of the peace or by causing terror to the public, of three or more persons assembled together whether they originally assembled for these purposes or no. When a riot becomes formidable any justice of the peace may command the persons assembled, if not less than ten in number, to disperse peaceably by a form of words called reading the Riot Act (1 Geo. I. chap. 5), thus: 'Our Sovereign Lord the King (or Lady the Queen) chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in an Act of King George for preventing tumults and riots assembled.—God save the King (or Queen).' (The omission of these last four words makes the reading a mere preliminary, to certify the understanding force in the prevention of serious outrages and damage to persons and property, it is not necessary to wait for the proclamation to be read, still less to wait for an hour after it has been read. Though death or wounds result to those composing the mob, such part is not deemed an excuse of the offense. The principal acts of felony, and liable to penal servitude for life. Prosecutions under the Riot Act must be commenced within twelve months of the time of committing the alleged offense. Sometimes the Riot Act is read more than once during the disturbance, in which case the second or third reading does not supersede the first. The Riot Damages Act, 1886, provides compensation from the rates to those whose property is damaged during a riot. Less serious than riot are unlawful assembly, a meeting of thirty persons or more for the purpose of committing an indictable offense, but where no part of the object is actually carried out; and rout, where the assembly proceeds to execute the act, but does not actually accomplish it: and affray, that is, a fight between two or more in some public place (e.g. a prize-fight), but it must not be premeditated. Of Course it is clear that in the case of any riot the police would be entitled to interfere and prevent the disturbance would be an assault. Among notable riots have been those in Scotland on account of the Union (1707); the Porteous Mob in Edinburgh (1736); Lord George Gordon’s ‘No Popery’ Riots (1780); at Birmingham (1791) in connection with the Common-Rights and Representation Bill. Another was the Reform Bill Riots at Bristol (1831); Chartist Riots (1838–39); Rebecca Riots in Wales (1843); religious riots at Belfast
Río Tinto, a river in southern Spain, in the province of Huelva, near whose sources are rich copper-mines; the annual output (copper and sulphur) reaches 1,400,000 tons; these minerals are exported from the port of Huelva, (q.v.), 45 miles distant by rail, near the mouth of the river. These mines were worked by the Romans—their Tharsis. During the years of Moorish supremacy they were unused, but they have been worked again since the middle of the 16th century. They were bought in 1841 by the London (Bremen) Syndicate for £4,000,000. Some 10,500 people are employed in the works, of whom unfortunately something like 10 per cent. are usually ill by reason of the unhealthiness of the work. See W. K. Lawson, Spain of To-day (1890).

Riouw, capital of the island of Bintang (q.v.) and headquarters of a Dutch residency comprising Bintang Islands, and large neighboring collieries and ironworks. Pop. (1851) 3671; (1891) 6815.—(2) A pretty village in the West Riding of Yorkshire, on the Nidd, 39 miles NNW. of Harrogate. Rebuilt in 1829-30, it has an hotel-de-ville (1854), an interesting church, and Ripley Castle (1555), where Cromwell is said to have slept the night before Marston Moor. Pop. 2091.

Ripley, George, was born at Groosfield, Massachusetts, 3d October 1802, graduated at Harvard in 1827, and was a member of the State legislature for three years, and was ordained to a pastorate in Boston. He held this till 1831. In the meantime he had joined actively in the Transcendental movement—the first meeting of the club was at his house in 1836; and on leaving the pulpit he at once started the Brook Farm (q.v.) experiment. This came to an end in 1847, and Ripley removed to New York, when he afterwards engaged in literary and journalistic work. He was joint-editor with Charles A. Dana of Appleton's New American Cyclopaedia. He died 4th July 1880. See Life by O. I. Frothingham in the 'American Men of Letters' series 1892.

Ripon, a city in the West Riding of Yorkshire, on the River Ure, 18 miles S.W. of York, 28 N. of Leeds, and 11 N. of Harrogate. A monastery, founded here in 660 by St Cuthbert and other monks of Melrose, was granted about 664 to St Wilfrid, who rebuilt the church with stone, and dedicated it to St Peter. Willibrord, the apostle of the Frisians, was buried in this monastery, which in 678 was made the seat of a short-lived bishopric, re-erected in 1836 after a lapse of more than ten centuries. The beautiful minster, which from the Conquest to the Dissolution was the church of Augustinian canons, was built between 1154 and 1520, so exhibits every variety of style from Transition-Norman to Perpendicular. A cruciform pile, 266 feet long, with three towers 120 feet high, which lost their spires in 1660, and with a Saxon crypt, where a hole called 'St Wilfrid's Needle' was anciently used as an ordeal of chivalry, it suffered much through the Scots (1319), decay, and vandalism, but restored by Sir G. G. Scott at a cost of £40,000. An obelisk, 90 feet high, in the market-place was erected in 1751 by W. Aislabie, for sixty years one of the two members for Ripon, whose representation was reduced to one in 1867, and merged in the county in 1885.

Ripon, Frederic John Robinson, Earl of, was born 1st November 1782, the second son of the second Lord Grantham. After graduating at Cambridge in 1804, he was attached to the diplomatic corps and served in various foreign countries. He returned to England in 1813, and was appointed Under-Secretary for the Colonies, a position he held until 1818. He was then appointed Secretary of State for India, a position he held until 1822. He was created Baron Grantham in 1822.

Ripon, Frederick John Robinson, Marquis of Ripon, was born 24th October 1827, and succeeded his father as Earl of Ripon and Viscount Goderich, his uncle as Earl de Grey, Baron Grantham, and a baronet. Since 1832 he had sat in parliament as a Liberal for Hull, Huddersfield, and the West Riding, and he became successively Under-secretary for War (1839), Under-secretary for India (1861), Secretary of State for India (1866), Lord President of the Council (1868), Grand-master of the Freemasons (1870, which office he resigned in 1874 on his conversion to Catholicism), Marquis of Ripon (1886), and was created Earl of Ripon and Viscount Goderich (1887), which title was popular with the natives, unpopular with Anglo-Indians, First Lord of the Admiralty in 1886, and Colonial Secretary in 1892-93.

Rip Van Winkle, the hero of Washington Irving's delightful sketch (1829), an idle, good-natured, heaped-scapes no, who neglects—he cannot be said to cultivate it—a patch of maize and potatoes in a small village near the Hudson River, and who, with his gun and dog Wolf, his companion in idleness, seeks a refuge from the scolding tongue of his sorely-tried but tenacious wife in the forests of the Catskill Mountains. There he falls in with Hendrick Hudson and his crew of the Half Moon, who are playing at ninemine in a secluded hollow, the balls as they roll echoing along the mountains like rumbling peals of thunder. Rip is directed to wait on them, and while doing so tastes and returns to the liquor he hands, till his senses forsake him. He wakens on a bright day, with the rusty firelock by his side; his beard has grown a foot long, and in the village he finds new buildings, new names over the doors, new faces at the windows. His own house is fallen into decay, his wife is dead—there is a drop of comfort, at least, in this intelligence—and he who went away a subject of George the Third has returned to find himself a free citizen of the United States. His
sleep, he discovers, has lasted twenty years, and meantime the American Revolution has passed and left all things changed. Rip, however, is recognized by some of his old acquaintances, finds a home at his daughter's house, and for many more years is as comfortable at the door of the new wooden Union Hotel as ever he was at old Nicholas Vedder's quiet Dutch inn. The story has been often dramatized, first in Germany, and a German edition has held the stage except Boucicault's (1865), with which the name of Joseph Jefferson is identified. The opera by Planquette (1882) also deserves mention, as keeping pretty closely to the story.

**Risshanger**

**WILLIAM,** a monk of St Albans, who styles himself 'chronigraphus' in an extant manuscript written by himself in 1312. He tells us, moreover, that he had been forty-one years a monk, and was then sixty-two years old, so that he must have been born in the year 1250. It has been usual to consider his chronica, which covers the period from 1259 to 1307, as a continuation of Matthew Paris, and it has been to a large extent borrowed from the annales of the Dominican friar, Nicholas Trivet. For example, as Mr Gairdner points out, the whole reign of Edward I. is almost exactly identical in the two. As a chronicler Risshanger is full and truthful, but his work is fragmentary towards the close, and besides some confusion has crept into the order of the narrative. The story is told with considerable spirit, and reveals high admiration for Simon de Montfort. The Willemi Risshanger Chronica et annales, forming vol. iii. of the chronica monasteriorum, has been edited for the Rolls series by H. T. Riley (1865).

**Rishi** is the title given to the inspired poets of the Vedas. See VEDA.

**Risotto** an Italian dish, consisting chiefly of rice. Onions are shreed into a frying-pan with plenty of butter, and they are fried together until the onions become very brown, and communicate their colour to the butter. The butter is then run off, and to this is added some rich broth, slightly coloured with saffron, and the whole is thickened with well-boiled rice, and served up instead of soup at the commencement of a dinner.

**Ristigouche.** See RISTIGOUCHE.

**Ristori,** Adelaida, an Italian tragedienne, was born on 26th January 1821, at Cividale in Friuli. Her parents were strolling players, and she joined the troupe at the age of fourteen she played in Francescan di Raimino, and in a few years became the leading Italian actress. In 1847 her marriage with the Marquis Del Grillo (died 1861) temporarily interrupted her dramatic career; but she soon returned to the stage. After having acted in Italy for some years with immense applause, she presented herself before a French audience in 1855, when Rachel was at the height of her fame. But Ristori won a complete triumph; and thereafter gained fresh laurels in nearly every country she visited. In the United States (in 1859 and 1875, and 1884-5), and in South America, where her magnificent tragic acting roused the greatest enthusiasm. The roles in which she especially shone were Mary Stuart (Shiller's), Elizabeth (Giacometti's), Meles and Meri (Antoinette (Lemont), Lady Godiva (Lisboa), and Antigone of Louvain (Scribe's). See her Studi e Memorie (Eng. trans. from French, 1888).

**Ritchie, Mrs RICHMOND.** See THACKERAY.

**Rittornello.** In Music, in its original sense, a short repetition, like that of an echo, or a repetition of the closing part of a song by one or more instruments. The same term is, by later usage, been applied to all symphonies played before the voices begin which prelude or introduce a song, as well as the symphonies between the members or periods of a song. The name is also given to the holding together of music in popular poetry, and consists typically of a strophe of three lamine lines, the first and third rhyming.

**Ritschl,** Albrecht, Protestant theologian, was born 25th March 1822, at Berlin, where his father was a clergyman. His university studies were carried on at Bonn, Halle, Heidelberg, and Tubingen. His name is also given to the holding together of music in popular poetry, and consists typically of a strophe of three lamine lines, the first and third rhyming.
is in fact identical with His grace. All metaphysical statements as to His absoluteness or existence through, or in, or for Himself are of no real significance. What is important is the relation of God, Ritschl attaches high importance to the conception of the church as being the community within which alone men can have reconciliation with God and freedom from the sense of guilt, and so be able to act from motives of love, and realise that human and divine fellowship of perfect love which is the kingdom of God. In this Ritschl expressly differs from Schleiermacher (in many other respects a master whom he follows closely); but, while rejecting the Protestant formula of the latter, that the relation of the individual to the church depends on his relation to Christ, he is very far removed from the position of Roman Catholicism. His doctrine of Christ attaches no value to the hypothetical distinction of persons in the Godhead or to the ecclesiastical doctrine of the two natures or the three offices, but states the divinity of Christ in its entire influence over his pupils, in relation to the church, which he founded by his life and work on earth. This work was atomic work; but the reconciliation with God and immunity from the sense of guilt which he secured for the church were obtained not by vicarious endurance of guilt, but by His perfect fulfillment, in loving deed and word, of the work of His calling, and by His perseverance in it in spite of all opposition, and by His patient endurance of all suffering even unto death. The justification possessed by the Christian as a member of Christ's community is practically shown in his freedom or dominion over the world. This dominion is exercised, in trust in God's providence, by patience, by humility amid all the vicissitudes of life, by faithfulness of the individual to his calling as being his contribution to the kingdom of God, and by Christian prayer, which is chiefly thanksgiving or humble recognition of the divine rule. Ritschl is usually classified as an 'eclectic mediating theologian'; perhaps 'intermediate' would be a better word, for his theology is uncompromisingly opposed alike by the 'rationalist' and by the 'orthodox' parties. The last formed a sort of university of the church at Leipzig, which was the most prominent among them being Kaftan, Herrmann, and Bender.

See the Life by his son Otto (2 vols. 1892–96); Stehlin, Kant, Lotze, and Ritschl (trans. 1880); Pfeiferer, Die Theologie und Christentum (1891); and works by Meikho (1894) and Pfenninger (1896).

Ritschl, Friedrich Wilhelm, classical scholar, was born at Grossvargula, near Erfurt, 6th April 1806. He studied at Leipzig and at Halle, held chairs of Philosophy at Breslau (from 1834), Bonn (from 1839), and Leipzig (from 1865), and died at Leipzig on 9th November 1876. As a trenchant critic of his great influence over his pupils, amongst whom were Curtius, Ilme, Brugmann, &c. His greatest work is an edition of Plautus (3 vols. Bonn, 1848–54; new ed. 1881–87), provided with the richest critical apparatus. This standard work was preceeded by Parerga Plautina et Terentiana (Leip. 1845). He achieved a second triumph in the department of Latin inscriptions, his collection, Praxis Latinitatis Monumenta Epigraphica (Berl. 1864), being the forerunner of the great Corpus Inscriptionum Latinarum. Ritschl's numerous critical papers and dissertations are collected in Quellenbuehnc (4 vols. 1871–79). His best work is his history of the best (2 vols. 1879–81); see also another by L. Muller (1878).

Ritsch, a learned and honest, but pedantic, acrid, and ill-mannered antiquary, was born of Westmorland yeoman family at Stockton-on-Tees, in 1792. He was bred to the law, and practised as a conveyancer in London, but was enabled by the profits of the office of Deputy High-justice of the Duke of Lancaster to give most of his time to studies. He made himself as notorious by his crazy vegetation, his whimsical spelling, and irreverence, as by the acerbity of his attacks on much bigger men than himself. Scott alone of his contemporaries kept good terms with him, but then none other had so dire a heart and genie humour. Undoubtedly Ritsch's mind was deranged, and he died in a fit of gloom, 31st September 1803. Ritsch's industry was remarkable, and all his forty books are valuable despite the blemishes in which they abound. His first important work was an abridgment of Warton's History of English Poetry (1782). Next year he assailed Johnson and Steevens for their text of Shakespeare; in 1790 he attacked Bishop Percy with asподлъ ferocity in the preface to a collection of Ancient Songs; in 1792 appeared his characteristic Curious Criticisms on Malone's Shakespeare.

Other works were A Select Collection of English Songs (3 vols. 1783); Pieces of Ancient Popular Poetry (1791); The English Anthology (3 vols. 1795–94); A Collection of Scottish Songs (2 vols. 1794); Poems, Songs, and Ballads (2 vols. 1795); Robin Hood: A Collection of all the Ancient Poems, Songs, and Ballads (2 vols. 1796); Bibliographica Poetica: A Catalogue of English Poets of the XVI–XVII. Centuries (1822); and Ancient English Christian Romances (1829). His various North Country Garlands and his Essay on Abstinence from Animal Food as a Moral Duty (1829) were less important. Joseph Halswood wrote a short account of his life (1834); his Letters were edited, with a Life, by Sir N. Harris Nicolas (2 vols. 1833).

Ritter, Heinrich, German philosopher, was born at Zerbst in Anhalt on 21st November 1791, studied theology and philosophy at Halle, Göttingen, and Berlin; was professor of Philosophy successively at Berlin (1824–33), Kiel, and Göttingen (1837–69); and died in Göttingen on 31st February 1869. His fame rests upon an extremely careful and impartial Allgemeine Geschichte der Philosophie (12 vols. 1829–53), with a continuation carrying on the work from Kant (1853); and upon Die Christliche Philosophie (2 vols. 1858–59).

Ritter, Karl, a geographer, was born August 7, 1779, at Quellinburg in Prussia, was educated at Greifswald, and studied in Halle, was in 1820 nominated professor of Geography at Berlin, became subsequently member of the Academy and Director of Studies of the Military School, and died 28th September 1859. With Ritter as the founder of general comparative geography begins a new epoch in the history of geographical science. His chief work (uncompleted) was Die Erdkunde in Verhältnisse zur Natur und Geschichte der Menschen ('Geography in its Relation to Nature and the History of Man'), 10 vols. Berlin, 1822–59. The work is divided into four parts—(1) Central Asia, Siberia, China, and India; (2) West Asia; (3) Arabia; (4) Sinai Peninsula, Palestine, and Syria. Besides this he wrote an Introduction to General Comparative Geography (1852); Europe (2 vols. 1807); and The University and Ancient Monuments in the Indo-Bactrian Royal Road, and the Colossus of Bambian (1838). His lectures were published in three volumes—History of Geography (1831), General Geography (1852), and Europe (1863) by Daniel. His name is perpetuated in two geographical publications in Berlin and Leipzig. See Life by Gage (Edin. 1867) and Kramer, Conrad, Ritter, ein Lebensbild (2d ed. Halle, 1875).

Ritual (Lat. rituare, 'book of rites'), the name of one of the service-books of the Roman Church, in which are contained the prayers and order of
ceremonial employed in the administration of certain of the sacraments (communion out of Mass, baptism, penance, marriage, extreme unction) and other matters; or a development of Tractarianism, though it is only a small part of what was described by Pusey and his associates as the Roman Ritual, especially any revival of disused vestments. Colateral causes of the movement may be said to be the great advance of aesthetic taste, and the increased cultivation of the fine arts in the service of religion; as also the extended study by the clergy of ancient church books, portions of which covered to exist between them and the offices of the English Church. With the spread of High Church principles certain changes in the mode of conducting divine service had been introduced by the clergy, which, though unpopular at first, were widely adopted, and up to a certain point had received the sanction of the law. But the restored church with low and open benches; the separated chancel; the altar-table with coverings of different colour according to the ecclesiastical seasons, and candlesticks, were applied to it; choral service, and weekly celebration of the communion were all that had hitherto been attempted. To these comparatively small alterations important additions were subsequently made, bringing the usages of the Church of England nearer those of the Roman communion, such as vestments at the celebration of the holy communion, and at certain other times—for the celebrant an alb, stoles of different colour, according to the seasons, and chasuble, and for the assisting ministers albgs with tunics; lighted candles on the altar at holy communion; a chalice, and a standing vessel; the mixing of water with wine for the communion; the use of wafer-bread; elevation of the elements either during or after consecration; and processions with crosses, banners, and vested attendants. The Public Worship Regulation Act, passed after fierce discussion in both Houses of Parliament, was expressly designed, as Mr Disraeli admitted, for the repression of ritualistic practices, and constituting a new judgeship for offences against the rubries (see ECCLESIASTICAL COURTS). By its provisions, a complaint against the use of vestments, ornaments, and rite and ceremonies, or the omission of such as are ordained in the Book of Common Prayer, in the churches or burial-grounds of the Church of England, may be presented to the bishop of the diocese by an archdeacon or churchwarden, or by three parishioners, members of the church, of full age, and a year's residence in the parish. In the event of the bishop's refusal to hear, the representa- tions of the bishop, he shall forward the case for trial by the judge, from whose decision an appeal lies to the Privy-council. Since the date of the act numerous trials have taken place, and several clergymen charged with ritualistic practices have been imprisoned (A. Pooth, 1877; Pehnais, Dale and Enraght, 1880; S. F. Green, 1882; J. C. Cox, 1887). See MACKONONIE, and ENGLAND (CHURCH OF). In 1889-90 proceedings were taken in the Archbishop of Canterbury's court against L. To. The decision was given in November 1890, and related to nine heads: (1) The mixing of the cup during the service is to be discontinued; (2) but the use of a cup already mixed is not an ecclesiastical offence; (3) the court disapproved the charge as to abjuration after service, holding that all the bishop had done was the reverent consumption of what remained of the consecrated elements; (4) as to the eastward position, the court decided that there is liberty as to using the north end of the altar or the north end of the west side; (5) the breaking of the bread must be performed so as to consist of no more than 16 pieces; (6) the singing of the antient 'O Lamb of God' is not prohibited; (7) candles, which are kept lighted throughout the service are not an offence; (8) the sign of the cross must be discontinued both in absolution and benediction; the use of the relics ALFAR, CHASUBLE, LIGHTS, VESTMENTS, &c.; ENGLAND (CHURCH OF), and PRAYER-BOOK; Lee's Diameter Anglicanum (1865); and the Priest's Prayer-book, with a brief Polihtical (6th ed. 1884).

Rivaro, ANTOINE, French writer, was born at Bagneux in Languedoc, 26th June 1733. Though the son of an innkeeper, when he appeared in Paris in 1750 he had dubious claim to rank, and soon worked his way by his wit into the best society of the time. Already he had written his treatise, Sur l'Universality de la Langue Francaise (1784), and paraphrased rather than translated the Inferno, when in 1788 he set all Paris laughing at the sarcasms in his Petit Almanach de nos grands Hommes pour 1788. At the Revolution he took his place in the royalist ranks, and saved his head by emigrating in June 1792. Supported by royalist pensions, the 'Tacitus of the Revolution,' as Burke styled him in 1793, employed himself fitfully in writing pamphlets and weaving dreams of books to be written, in Brussels, London, Hamburgh, and Berlin. He had married an English wife, but she quarrelled with him, and not without reason. Rivarol died at Berlin, 13th April 1801. His works were collected by Chénédolle and Fayolle (5 vols. 1805), but their terse epigrammatic quality shows better by compression in the Esprit de Rival (2 vols. 1808) and the Oeuvres Choises, edited by Lesure (1822; new ed. 1880). See also Rivarol, Antoine, French pendant la Révolution et l'Emigration (1883).

Rivas, a decayed town of Nicaragua (q.v.), 6 miles from Lake Nicaragua. Pop. 8000. The fertile department of Rivas, between the lake and the Pacific Ocean, has an area of 1080 sq. m. and a pop. of some 25,000.

Rivaulx Abbey. See RIEVALUX.

Rive-de-Gier, a town of France (dept. Loire), stands on the Gier, in the middle of the best coal-field in France, 13 miles N.E. of St Etienne by rail. It was formerly a stronghold, surrounded by high walls, and defended by a castle. In 1815 it had less than 4000 inhabitants; in 1886, 13,728. Around the town there are about fifty coal-mines in operation, and in it and close to it several silk-mills.
glass-works, factories for steam-engines and other machinery, and iron and steel factories.

River. Water falling on the land in the form of rain, or resulting from melting snow, or rising to the surface from underground, collects on the surface of the land to a lower level. Where two slopes of land dip together the surface drainage collects to form a stream, and when evaporation is not very rapid several such streams ultimately unite and the volume of water they carry flows to the sea or to a salt lake. Small streams are termed runnels and rivulets, rills, brooks, becks, or burns; large streams are termed rivers, but the word has no precise reference to the magnitude of the stream to which it is applied. Dr Johnson gives as definitions: 'Brook, a running water less than a river;' and 'River, a land current of water bigger than a brook,' and this fairly illustrates the use of the words as popularly applied.

The beginning of a stream,—whether brook or river,—is called its source, and may be a spring issuing from underground, a lake or marsh in which rainfall accumulates, melting snow, or simply the gathering trickles from falling rain. The path of a stream is its course, and is the line of lowest level from the source to the end, which if occurring in a lake or the sea is termed its mouth. The connected streams which unite in one river form a river-system. The series of convergent slopes which drain the land on which it drains—forms its basin or catchment area, and the name watershed is also sometimes erroneously applied to it. The names watershed, water-parting, and divide are used to designate the boundary line separating adjacent basins. A watershed is the meeting-place of the highest part of divergent slopes, and from the characteristic form of continents the main watershed or a continent is almost always the crest of a range of mountains. In many cases, however, the diverging slopes meet in a low plain the summit of which may be occupied by a great marsh whence rivers creep away in opposite directions. The basins of all the rivers draining into the same ocean are called collectively the drainage area of that ocean. The main river to which the others gather or are tributary is given its name in the river-system. It is often difficult to decide which of several converging streams is entitled to carry the name of the main river to its source. Some geographers give this distinction to the longest, others to that with the highest sources, and others to the one which first enters a large river. This divergence of opinion is increased when the name of a river leaving a large lake is given to one of several nearly equal streams which enter it. Hence it is that different computers disagree as to the length of rivers. The course of a typical river has been divided into three parts, although these are not represented in all cases. The torrential or mountain track is the steepest, its gradient usually exceeding 50 feet in a mile, and the velocity of its current being very great. The valley or middle track has a gradient which is rarely greater than 10 feet and often less than 2 feet in a mile. The surface track nearest the mouth of a river has a gradient of only a few inches in a mile. Rivers such as the Amazon, Mississippi, Ganges, Volga, and the long rivers of Siberia, in which the plain track is of very great length, are the most valuable for navigation, the liveliness and navigability being a gradient of about 1 foot in a mile.

The velocity of a river is proportional to the slope of the bed, but it also bears a relation to the depth of the channel and the volume of water flowing in it. On account of friction on the bottom and sides of the channel retarding the stream, the water flows fastest on the surface and in the middle. The carrying power of a river for suspended solid particles and for stones and gravel pushed along the bed depends on the velocity alone. The following table shows how rapidly the carrying power falls off as the velocity diminishes.

That the velocity of a river increases downstream, is shown by the fact that lakes or ponds, whether in the country or in the city, are generally found near the source of the stream. The height of the water above spring tide is less at the mouth than at the source; and the water is slowest at the headwaters, where it is fresh, and swiftest at the mouth, where it is salt. The mouth of the river is the delta, formed by the water depositing at its approach the material worn by it; the deposit is largest and of most value where the river enters the sea from the north, and is least and of least value where it enters the sea from the south. The mouth of a river is also made shallower and wider by the deposit of material washed in from the adjacent uplands and islands. Rivers are the great agents of erosion; the most effective agents in the mountainous regions being the revolving landslides, in the submarine regions, the submarine canals, in the river regions, the subterranean canals, carved in the rock. When a river approaches a level plain it forms a lake, and when the level plain is a desert it forms a salt lake.
margin. These are increased in height by each successive flood, and, the river-bed being simultaneously slilted up, broad muddy rivers like the Mississippi, Po, and Hoang-ho come in time to flow along the top of a gently sloping natural embankment, the sides of which are defended by great banks of deposit (see Delta), or by bars of gravel or sand. In some cases, however, such as the River Plate, the Thames, and Tay, the mixture of river and sea water is gradual, and the sandbanks are spread over a very large area, but not built up into a delta at any one place. Professor Osborne Reynolds has shown, by a remarkable series of experiments, that the form of the sand-banks is due to the outline of the coasts of the estuary and to the tides. In a few instances, such as the Po, rivers enter deep channels of the sea which neither banks nor bars are formed. The Congo sweeps directly into the ocean, throwing down great banks of deposit along the continental slope to right and left, but leaving a deep caisson-like gully for the bed of the stream itself; a similar curved gully occurs where the Rhone enters the Lake of Geneva.

The ultimate source of all rivers is the condensation of water-vapour from the atmosphere in the form of rain, snow, and even dew. If the land were composed of impermeable rocks all the rain-water would not be lost by evaporation, would rise off directly over the surface, and rivers would only flow during and immediately after showers. A large part of the rainfall, however, soaks into the soil, which retains it as in a sponge, especially if the land be marshy, and allows it to flow off gradually as superficial springs. Some percolates deeply into the rocks, ultimately emerging as deep-seated springs at a great distance. The indirect and permanent supply of water to rivers by springs and by the outflow of lakes is incalculable, and part of the surface water left upon the land serves to maintain the volume of the river at a certain minimum during the dry seasons. When a river flows toward a region of great evaporation and small rainfall, such as exists in the interior of each of the great continents, evaporation removes more water from the river than it receives from the rains, and the stream may fall to fill the hollow it enters, and therefore cannot overflow into the sea. This is the case with the Oxus entering the Aral Sea, and the Volga entering the Caspian. It may be that evaporation is so far in excess of contributions from distant rainfall or snow-melting that the river dries up as it flows, and its last remnant is absorbed in the desert sand. This is the fate of the Murgab, the Heri-rud, the Zerashfan, and many other rivers of central Asia.

The largest in the world are those in which the periodical or occasional increments of direct inflow increase the volume so much as to cause a great rise of level or even extensive inundations. The annual inundations of the Nile are due to the monsoon rainfall on the great mountains of Abyssinia and the Western Ghats. The flow of the Niger to fifteen times the amount of the river at its lowest. The Orinoco is another instance of seasonal rains producing tremendous inundations, over 40,000 square miles of the Llanos being said to be laid under water by the seasonal overflow. The Nile in Egypt is an instance of a river which is always more or less in flood as the various tributaries attain their greatest height at different seasons. In June, when the highest level occurs in the main river, 20 or 30 miles of forest on each side of its banks are laid under water for hundreds of miles. The Ganges overflows its banks in summer when the monsoon rainfall is reinforced by the melting of snow on the Himalayas. Where the seasons of rainfall and snow are widely separated, as in the Mississippi, the Tigris, and Euphrates, there are two regular floods in the year. The danger of flooded rivers arises from the suddenness with which the water rises and overflows its banks. Frightful devastation follows the bursting of dammed-up reservoirs, as in the Volga, when some lakes in mountain-valleys (see Lake). The great rivers of Siberia remain frozen at their mouths long after the ice and snow have been melted in the interior, and broad strips on their margins are needlessly laid under water by the natural outflow being stopped. The most serious floods in the Danube and Theiss have resulted from the construction of the channel at the Iron Gates, which prevents the flood water from passing away as rapidly as it comes down; the current of the rivers as a result of the water accumulating, the widening of the channel has been repeatedly attempted as a remedy by increasing the outlet; and an elaborate system for regulating the river here, to be completed in 1895, was begun in 1806. In other cases, such as the tributaries of the Loire, and the south branch of the Po, the natural outfall of the water is prevented, the melting snows swell the torrential track, and, on account of the abrupt change of level and the flatness of the plain, the lower part of the rivers cannot carry away the immense volume of water rapidly enough, and floods result. In some instances torridal rivers have been successfully diverted into lakes, which regulate their outflow, preventing either dangerously high or extremely low water. Great rivers which have embanked their course above the level of the plain are the most dangerous of all when flooded. The damage caused by the bursting of the levees on the lower Mississippi necessitates a great expenditure in strengthening the embankments, and the most disastrous inundations recorded in history have followed the bursting of the banks of the Hoang-ho (q.v.) and its tributaries on account of course.

River-water is spoken of as fresh, but it always contains a certain amount of solid matter in solution, varying from two grains in the gallon or less in rivers draining hard crystalline rocks to fifty grains in the gallon or more in limestone districts. The nature of the solid deposits of the river depends, according to the geological character of the country traversed, but all samples of river-water differ from sea-water in containing a much smaller proportion of chlorides, and a very much larger proportion of carbonates and of silica.

The temperature of rivers as a rule follows that of the air, but is subject to variations on account of the effect of rain. During sudden floods in summer the temperature of the water may fall many degrees in a few hours as the meltwater snow and ice from the lofty mountains is carried toward the sea.

The great rivers of Europe and Asia, such as the Rhine, Danube, Volga, Indus, Ganges, Brahmaputra, Yang-tse-kiang, afford access to the sea to enormous populations. The Amazon, with its plain track extending over about one hundred and thirty degrees of latitude, is its station is a river which always moves less like a river than a fresh inland sea; but the Mississippi and St Lawrence, although less extensive, are of greater value for carrying sea traffic to inland places. In their torrential and rapids valley the rivers are chiefly for transporting timber and driving machinery. It is interesting to note that in Switzerland, Norway, and Sweden, where there is no coal, there exist exceptional facilities for the use of water-power on
account of numerous mountain-torrents. In hot countries rivers are of the utmost service in irrigating agricultural land; the Zerafshan and Manghah are entirely consumed in that service, and since the completion in 1800 of the aqueduct on the Nile, no water escapes to the Mediterranean in the low Nile months except along irrigation canals.

The statistics of this table, in which account is taken of rainfall and discharge, are taken from Dr John Murray's paper in Scot. Geog. Mag. iii. (1887) p. 65. The lengths in all cases and the areas of basins in those for which no rainfall statistics are available are according to the statistical tables in Justus Perthes' Taschen-Atlas.

Rivers in Law.—A distinction is made between public navigable rivers and private fresh-water rivers. Where the tide ebbs and flows, the ownership of the bed is in the crown for behalf of the public, and, consequently, the crown is entitled to deepen the channel or perform any other operation on the aveus that may improve the navigation. The banks, however, beyond the foreshore are the private property of the riparian owner. It is settled in England—and an opinion of the same effect has been delivered in Scotland—that the public have no common law-right to set up even a towing-path along the bank of a navigable river; but, of course, such a privilege of roadway along a public waterway may be established by prescriptive possession. And if the ordinary level of the tide on all rivers and streams are public for navigation, although either by immemorial use or by act of parliament, many have become subject to public rights of navigation. In the case of private rivers the aveus belongs to the proprietor through whose ground the river runs; or, if the river separates the lands of two owners, each is owner of the soil of the bed to the middle of the stream. The waters of a stream passing through or between the lands of different proprietors may be subject to two kinds of rights, natural and acquired. Natural or proprietary rights are those possessed by every riparian proprietor; they consist principally of a right to a reasonable use of the water, while it is flowing past his land, and a right to have the water flow in its accustomed manner, without sensible disturbance or diminution by the superior or interior riparian proprietor. Thus, although such proprietor may employ the water while it is within his own grounds, he must allow it to pass onwards to the inferior proprietors in its original channel, and cannot alter its level, either where it enters or leaves his property. The riparian proprietor, either in a public or private river, may protect his side of the stream by embankments; but such embankment must be constructed only for defence, and not in such a manner as to throw the force of the current upon the opposite bank. Acquired rights, on the other hand, are those easements which a riparian proprietor to interfere with a natural stream of water to an extent not justified by his natural or proprietary rights—by diminishing or obstructing the flow of water, by polluting it, &c. Such acquired rights in respect of water may exist in the inhabitants of a district by virtue of immemorial custom, and, both as to kind and extent, are regulated wholly by prescription.

The pollution of rivers has of late years, in consequence of the extension of manufactures, caused serious concern. No person has a right to poison or pollute a stream, and if he do so any of the persons whose lands abut on the stream lower down may bring an action to recover damages. While, however, this right to object to an existing nuisance may be excluded by acquiescence or by prescription, it is so excluded only to the extent of the actual use or possession, and any material increase of the pollution or annoyance may be challenged and interdicted by a judicial remedy. At common law, indeed, in every question of river-pollution, the real question of fact is whether there has been any material increase of pollution beyond that which is natural to the particular stream, or beyond that which has existed there for the prescriptive period. The rights of rivers are not to be fitted for submission to a jury, and are generally disposed of in that way. The whole circumstances must be considered; for example, the size and character of the stream, the use to which it can be and is applied, the nature and importance of the use claimed and exercised by one party, as well as the inconvenience or injury to the other party. In England, where the pollution of a stream amounts to a public nuisance, the party causing it may be prosecuted by indictment, or proceeded against by information at the suit of the Attorney-general. All the chief modern sanitary acts have provisions regarding the pollution of water; but most of them are local or deal with the pollution of water used for special purposes. In 1868 a Royal Commission was appointed to consider the question of river-pollution, and its recommendations were followed in the laws of 1871, 1872, and 1876. See Duke's Pollution Acts. (29 & 30 Vict. chap. 75), which is applicable to both Scotland and England. See Higgins, On the Obstruction and Pollution of Water-courses (1877).—For fishing rights, see SALMON, and TROUT.

In the United States the common law of England was adopted, and although all the states it is expressly declared that the common law is inapplicable. Mining rights have been specially determined in some districts; and the laws as to irrigation rights have been elaborately defined in Colorado and elsewhere.

Rivera, a department in the north-east of Uruguay, separated by a mountain-chain from Brazil. Area, 3790 sq. m. ; pop. 17,087.

Riverina, a name given to the extensive grazing districts in the western part of New South Wales, Australasia.

Rivers, Richard Woodville, or Widvile, Earl, was esquire to Henry V., and during his son's reign was made Governor of the Tower (1424) and knighted (1425). He fought in France in 1428, and in 1440 against the Lancastrians. He took to wife Jaquetta of Luxembourg, widow of the Duke of Bedford, and it was their daughter Elizabeth whom Edward IV. married. This led Sir Richard Woodville to change over to the Yorkist side, and his royal father-in-law made him successively Constable of England, Baron Rivers (1448), and Earl Rivers (1465). But the favour shown to the Rivers family offended

seized
of English History) gives them as follows: 'The Watling Street represents the old zigzag route from Kent to Chester and York, and northwards in two branches to Carlisle and the neighbourhood of Newcastle, the Fosse Way ran diagonally through Bath to Lincoln. The Ermin Street led direct from London to Lincoln, with a branch to Doncaster and York; and the obscure Icknield Street curved inland from Norwich to Dunstable, and was carried eventually to the coast at Southampton.' Watling Street and Icknield or Icknield Street have separate articles in this work.

Through a large part of the land in Great Britain gradually fell into decay, and the attempts that were now and then made to repair them were insufficient to prevent England falling into a worse state with respect to its highways than most other European countries. In 1285 one of the earliest laws on the subject of roads was passed. It directed that all trees and shrubs be cut down to the distance of 200 feet on either side of roads between market-towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III. in 1340, on roads which now form part of the streets of London. In 1555 an act was passed requiring each parish to elect two surveyors of highways to keep them in repair by compulsory labour; at a later period, in place of the compulsory labour, the 'statute labour-tax' was substituted.

But long after this the roads even in the neighbourhood of London were wretchedly bad, and in the other parts of the country they were still worse. For the most part, indeed, they were mere horse-tracks; the chief advantage in following them being that they led along the higher grounds, and so being above water were usually impassable in winter, being narrow, and in many places so deep and miry as to be like ditches rather than roads. So late as 1736 the roads in the neighbourhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St James's Palace in less than two hours, and sometimes stuck in the mud altogether. Much curious information on the state of the roads and means of conveyance in England during the long period which elapsed from the decay of the Roman roads to the middle of the 18th century, will be found in Mr. Ickham's Lines of Engineers. The Highlands of Scotland were opened up by the roads made by General Wade about 1725.

In laying out a new line of road the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking, and to do so without deviating much from the direct course between the fixed points through which the road must pass. To succeed well in this an accurate survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The level line of a road often involves the construction of extensive bridges, viaducts, and the like, which require the greatest engineering skill.

The importance of easy gradients or inclinations in roads is well understood in a general way; but it is of the greatest importance to state that, while, for example, the traction force requisite to draw a wagon weighing 6 tons along a level macadamised road is 264 lb., on a road of the same kind with an ascent of 1 in 50 the traction force is just double, or 533 lb., the speed of the wagon being 3 miles an hour. Compare, however, a stagecoach travelling on the level at the rate of 6 miles an hour, and weighing 3 tons, requires a traction force of 302 lb.; but the resistance on a hilly road is less unfavourable to the coach than to the wagon, because with an incline of 1 in 70 the forces necessary to draw the two vehicles are about equal, and the force is proportionally greater for the wagon as the incline increases. Experience seems to show that for a macadamised road the maximum slope should be 1 in 40, although a horse with a moderate load can easily trot over a gradient of 1 in 33. On the other hand, as it is not desirable for drainage to have a road perfectly level, the best minimum slope, in a longitudinal direction, has been variously given at from 1 in 80 to 1 in 125. The resistance to moving vehicles is less on paved than on 'metalled' roads; hence the maximum slope of a metalled road should be less than that of the latter, from the greater tendency of a cart or coach to slide down the smoother surface.

What is the best transverse form for a road has been a much-debated question among engineers. It should be higher in the middle than at the sides; but some have thought it should be much higher than others. As a road can be better kept clear of water by a slight inclination in the direction of its length than by any form which can be given to its cross section, it has been found preferable that it should be as nearly flat as possible, because every part of its breadth will then be equally available for traffic; whereas it is almost necessary to keep on the centre of a highly inclined road, and consequently wear deep furrows there, by confining the wheels and horses to pretty much the same track. The figure shows a transverse section of a road in the form of a segment of a circle—the most approved form—with only a slight rise in the centre. The slope from the side to the middle should not exceed 1 in 36.

As respects the construction of the road itself, the first point to consider is the foundation or subroad. The majority of roads have no artificial foundation. In such cases the surface on which the road material is to be laid is generally made as solid as possible by means of efficient drainage, and by rolling and beating wherever there are embankments formed. It is the question whether or not a road should have a foundation of rough pavement below the broken stone covering which is the essential point of difference between the two great rival systems of Telford and Macadam. Telford, who began to construct roads in 1803, considered it of great importance that there should be such a foundation. He made it of stones varying in depth from 9 inches at the centre to 3 inches at the sides of the road, these being set with their broadest edge downwards, and no stone being more than 4 inches broad upon the upper edge; upon these were placed a coating of broken stones not exceeding 6 inches in thickness. The Glasgow and Carlisle and the Holyhead roads are constructed on the same lines as the road made of stones laid one upon the other on the road in telford's plan. Macadam (q.v.) preferred a yielding and soft foundation to one which was rigid and unyielding, so that even on boggy ground, if it were but firm enough to allow of a man walking over it, he considered an artificial laying quite unnecessary. His roads were formed entirely of angular pieces of stone of such a size as to pass freely through a ring 24 inches in diameter. This plan, first put into practice about 1816, has now few advocates than Telford's, or than

Cross Section of a Road:
- A, foundation of rough pavement or concrete; B, broken stones.

The diagram shows the gradient and alignment of the road, as well as the typical cross section. The road is designed to minimize resistance to traffic flow while ensuring durability and proper drainage.
the one subsequently proposed by Mr Thomas Hughes, where a concrete of gravel and lime is employed for the foundation of the road. But experience has shown that, except in the case of streets with very heavy traffic, Macadam's plan of employing angular pieces of stone is superior to even other covering for roads, whether they have an artificial foundation or not. So popular at one time was the system of macadamisation that expensively paved streets were torn up to be re-formed on the new plan. The advantage of angular pieces of stone is that they dovetail into one another, and do not break up and shift when their surface is worn.
but an act of parliament can legalise such uses of a public road as
Subject to the rights which he has conferred on the public, the owner retains his right of property in the land. If the land on both sides of a highway belongs to the same owner, it is to be presumed that his rights extend over and under the road, if the land on one side belongs to A and on the other side to B, each is presumed to be owner up to the middle line of the way. If, for example, a mine should be opened in the neighbourhood of the road, the adjoining owner or owners would have the right to mine under it, so long as sufficient support is given to the surface of the land. If a water or water company without authority of parliament takes up a road to lay its pipes, this is not only a nuisance but a trespass, for which damages may be recovered by the owner of the land. It has been held that a person loitering on a highway for the purpose of poaching may be indicted for trespassing on the land of the adjoining owner.

The repair of a carriage-way involves a regular outlay, and there are some cases in which this burden is imposed upon the owner of the land, *ratione tenure, as a part of the service by which he holds that tenement*. But there is a rule of common law that the inhabitants of a parish must repair the highways within the same; they are liable to indictment if they fail to perform this duty, and no agreement can enter into will relieve them of their liability. Many townships, &c., which are not separate poor-law parishes are separate highway parishes by ancient custom. The management of highways separately maintained by the parish was regulated by an act passed in 1835, and amending acts; a parish surveyor was elected by the ratepayers; in parishes over 5000 population a board might be elected. By an act of 1862 many parishes were grouped in districts. The highway board of a district consisted of waylearders elected for the parishes therein, and of the acting justices who reside in the district. Under the Public Health Act an urban sanitary authority was made the highway authority within its district. Many of the main roads throughout England were constructed or improved under Turnpike trusts, constituted by acts of parliament. Turnpike trusts and highway boards have alike been superseded by the provisions of the Local Government Act of 1888. The arrangement of the main roads of a county now rests with the county council, and the burden of their maintenance is a county charge. The rural district councils are the highway authorities for highways other than main roads, and have the powers of the surveyors of highways. In boroughs the powers of the county council are exercised by the corporation. The parish councils take charge of the repair of foot-paths. Tolls had been generally abolished before these sweeping changes in road management; see Toll. Legislation as to road-engines and motor-cars is Act 1896.

In the law of Scotland a highway is said to be *inter regaliam* ; but it seems that the presumption is that the land over which a road passes belongs to the adjoining owner or owners. Public rights of way are acquired by actual use for the prescriptive period of 21 years. There are formerly two classes of roads—statute-labour and turnpike; by the Roads and Bridges Act, 1878, the management of all roads was vested in county road trustees; by the Local Government Act of 1889 the powers of the road trustees were transferred to the county councils. When they are managed by the town council or the commissioners of police.

For an outline of the English law, see Wright and Hobhouse, Local Government in England; for the Scotch law, Goudy and Smith, Local Government.

---

**Roanne**. a town of France (dept. Loire), 52 miles E. N.W. of Lyons, stands on the right bank of the Loire, which becomes navigable here, and is crossed by a stone bridge (1820). The principal church is St. Stephen’s (15th to 17th century). Roanne has besides an old castle with antiquarian collections, a new hotelling-de-ville with public museums, and some governmental trade, especially in Lyons manufactures, in iron and coal, and oriental wares. Pop. (1872) 18,615; (1886) 30,060; (1891) 29,744.

**Roanoke**. a river of Virginia and North Carolina, formed by the union, a mile above Clarksville, Virginia, of the Dan and Staunton rivers, which rise in the Alleghenies, flows south-east through the north-eastern portion of North Carolina, and empties into Albemarle Sound. It is navigable for steamboats to Weldon (130 miles); its length is 290 miles.

**Roanoke**. a city of Virginia, on the Roanoke River, 238 miles by rail W. of Norfolk, at the junction of the Shenandoah Valley and the Norfolk and Western Railway. In 1880 it was a small, bustling city, with a church house, opera-house, hotels, churches, gas, coal and electric lights, large machine-shops, steel and iron works, a rolling mill, tobacco, spoke, and canning factories, bottle-works, &c. Pop. (1880) 609; (1900) 21,493.

**Roaring**, popularly known as a disease, is only a symptom of disease in horses. It consists in a more or less loud unnatural sound emitted during the act of inspiration. As a rule it is first manifested by an animal making a slight noise, but this slowly increases in loudness and intensity, and in many cases the animal becomes useless whilst still comparatively young. Whistling is a modification of roaring, and is due to similar causes. The disease is found to be due, in the great majority of cases, to a wasting, atrophy, and fatty degeneration of the muscles of the larynx, but more particularly of those of the left side. This is partly at least explained by the fact that the nerve supplying the motor power to the left side is given off deep within the chest, winding round the posterior aorta, whereas that on the right is given off opposite the first rib, just at the entrance into the chest, and that the left nerve is more apt to be implicated in diseases of the chest than the right. Still the nervous theory is not quite satisfactory, as the same anatomical arrangement is found in other animals, yet roaring from muscular atrophy is not known among them, and many ‘roarers’ whose history has been known from birth have never suffered from chest affections, whilst others severely affected with chest disease have not become roarers. Again, mares and ponies are not nearly so prone to become roarers as males and larger horses.

The development of roaring is often due to catarrh, strangles, or some other disease affecting the respiratory organs, but it is not known that these diseases are not sufficient of themselves to cause it, provided there be no hereditary taint, this hereditary taint alone being sufficient in many instances to induce roaring without the advent of another disease. There is no cure for it, all attempts to stop it from this disease being an unproved abortive. In 1887 an operation for the cure of roaring was reintroduced by Dr. Fleming, then principal veterinary surgeon to Her Majesty’s forces. Similar operations had been performed by Günther, in Hanover, so far back as 1834. It consists in leaving a long incision in the skin of the animal being under chloroform, and removing the arytenoid cartilage and vocal chord of the paralysed side. Some horses were slightly benefited, but many became worse than before the
operation, and had to be destroyed. This proved a great disappointment to the veterinary profession, as hopes had been held out that at last a cure for roaring could be found.

Roaring is now included by the Royal Agricultural Society of England among the hereditary unsoundnesses, and their veterinary officers are instructed to disqualify all horses exhibited at the great national show that give any signs of this grave hereditary disease. See works by George Fleming (1889) and T. J. Cadiot (trans. 1898).

Roaring Forties, a sailor's term for a region of the great Southern Ocean lying south of 40° S. lat. (especially south of 45°), where the prevailing winds are strong WNW. and NW. winds, often followed by a hailstorm. It is acting for robbers that the outward voyage to Australia is made by the Cape, and the homeward voyage by Cape Horn. The same name is sometimes given by analogy to a belt of the North Atlantic about 40°–50° N.

Robben Island (Dutch, 'seal island'), an islet at the entrance of Table Bay, 10 miles NW. of Cape Town, which was a leper colony, then a lunatic asylum from which long-term patients were removed. The management of which latter institution caused some discussion in 1889 and 1890.

Robber Connell. See EUTYCIES.

Robbery is the taking and carrying away, either with violence or with threats of injury, of a thing which is on the body or in the immediate possession from which its owner is unable to prevent it, or if taken under such circumstances that in the absence of violence or threats the act committed would be a theft. In order to constitute the crime, the robber must actually obtain possession of the goods. Further, it is well established that no sudden snatching of property by unawares from a person insufficient to constitute robbery, unless some injury be done to the person, or there be a previous struggle for the possession of the property, or some force used to obtain it. By statutory law in England and Ireland (24 and 25 Vict. chap. 96) the punishment for robbery is imprisonment or penal servitude, varying according to the nature of the violence or threats used. By the Criminal Procedure (Scotland) Act, 1857 (50 and 51 Vict. chap. 38), the jurisdiction of sheriffs has been extended to robbery, and the sheriffs are cognizable only by the Court of Justiciary. It is, however, to be noted that this extension of jurisdiction does not render bailable crimes, such as robbery, which were not formerly bailable. By the above-mentioned statute it is now competent, under an indictment for robbery, to vest the robbery, to recover, or attempt to rob. An act of robbery committed upon the high seas constitutes the offence of piracy at common law, and each state is entitled to visit the crime with the penalties which its own laws may determine. In England cases of piracy are now tried at the Central Criminal Court and at the assizes.

Robbia, Luca della: sculptor and modeller of figures in relief, was born at Florence in 1399 or 1400, worked all his life there, and died there on 20th February 1482. He designed and executed between 1429 and 1434 ten panels of Archangels and Dancing Boys for the cathedral, which Professor J. H. Middleton calls one of the greatest pieces of sculptured work in the 15th century. Another great work by him was a bronze door, with ten panels of figures in relief, for the sacristy of the cathedral, made from the marble he sculptured. In 1437–58, the tomb of Federighi, Bishop of Fiesole (now in the church of San Francesco outside the city). The frame that surrounds this monument is made of exquisitely painted majolica tiles. It is closely associated with the production of figures in glazed or enamelled terra-cotta, made by a process which, though he did not invent it, he yet perfected greatly. Amongst the works he executed by this process are numerous medallions, made in white enamel on a grey ground. His principal pupil was his nephew ANDREA (1435–1523), who worked chiefly at the production of enamelled reliefs, retabls, and medallions, these last for the most part reproductions of the Madonna and Child. Nearly all his works were of religious subjects; thus a panel of St Euphemia ((q.v.) is by him). His son Giovanni (1469–1530) continued the activity of the family in this style of work; his best productions are the frieze, representing the Seven Works of Mercy, outside a hospital at Pistoia, and a fountain in the sacristy of St Mary Novella in Florence.

See Cavallucci and Molinari, Les Della Robbia, leur Vie et leur Oeuvre (1884); Leader Scott, Luca Della Robbia (in 'The Great Artists' series, 1885—10 be used with caution); and M. Raymond, Les Della Robbia (Florence, 1887).

Robert I. (of Scotland). See Bruce.

Robert II., king of Scotland 1371–90, was born 20 March 1316, two years after the battle of Bannockburn. His father was Walter Stewart (q.v.), his mother Marjory, only daughter of Robert the Bruce; and both parents he lost in infancy. Throughout the disastrous reign of his uncle, Sir David II., he suffered much of the bitterest. The patriotic nobles of Scotland, twice acting as regent during his exile and captivity, and fighting at Halidon Hill (1333) and Neville's Cross (1346). On David's death (22d February 1371) he obtained the crown, and became the founder of the Stewart dynasty, in whose interest the last of the Wemyss works of the law of succession self by the Council of Estates at Ayr in 1315. 'A man not valiant,' Froissart says of him, 'with red blear eyes, who would rather lie still than ride;' and partly from disposition, partly from the infirmities of age, Robert proved a peaceable, if not exactly a pusillanimous, ruler. Such wars as were waged with England were not only conducted, but organised, by his powerful and intractable barons, particularly the Earls of Douglas, Mar, March, and Moray, who shaped the policy of the country very much according to their pleasure. The misery inflicted on both sides of the Border by the raids of these warlike chiefs, and the reprisals of the English wardens—the Peresies and others—were frightful; famine and pestilence became chronic, but the most celebrated incidents of Robert's reign were the invasion of Scotland by a foreign military and naval force under the command of the Duke of Lancaster ('old John of Gaunt, time-honoured Lancaster') in 1384, and again by King Richard II. himself in 1385, which wasted the land as far as Edinburgh and Fife, and the grand retabulary expedition of the English in 1388, which culminated in the battle of Otterburn (q.v.). Robert died at his castle of Dundonald in Ayrshire, 19th April 1390. He married first, in 1349, his mistresses, Elizabeth Mure of Tovallian, and secondly, in 1355, Euphemia, daughter of the Earl of Ross and widow of the Earl of Moray.

Robert III., king of Scotland 1390–1406, son of the preceding, was born about 1340. His baptismal name was John, but this name, out of hatred to the memory of John Baliol, was changed on his accession to the throne by an act of the Scottish Estates. His imbecility as a ruler virtually placed the reign of his uncle, in the hands of his ambitious brother, Robert, Earl of Menteith and Fife, in 1398 created Duke of Albany, during whose reign the Scottish barons first began to exercise that anarchic and disloyal authority which, in the reigns of the first three Jameses, threatened to destroy the power of the sove-
regain altogether. The principal events in Robert's reign were the invasion of Scotland in 1402, and his march to Peiwar Kabul in 1851. The expedition of the 18th century, under Archibald Douglas, which laid waste in the territory of the Hindustan Hill (q.v.). Robert had two sons, the eldest of whom was David, Duke of Rothesay (1378-1402), a youth not destitute of parts, but shocking for licentiousness. As long as his mother lived he kept within bounds, comparatively speaking; but after her death, says Buchanan, he 'reared and adorned himself, laying aside fear and shame, he not only seduced married ladies and virgins of good family, but those whom he could not entice he forced to his embraces. Albany received orders from the king to act as his guardian, and after a short time starved him to death at Falkland; for which he underwent a mock-trial by his own creatures, and was of course declared innocent. Robert now became anxious for the safety of his younger son, James, and, after consulting with Archibald Wardlaw of Sandhurst, he resolved to send him to France: but, while proceeding thither, the vessel in which he sailed was intercepted by an English cruiser, and James was taken prisoner (1405). When his father received the melancholy news he gave way to paroxysms of grief, and died at Rothesay Castle, 4th April 1406.

**Robert of Brunne.** See Brunne

**Robert of Gloucester.** See Gloucester.

**Roberts, David**, landscape and architectural painter, was born at Edinburgh (in Stockbridge) on 29th July, 1790, and was apprenticed to a house-painter. In 1818 he advanced to the grade of scene-painter, and in 1821 went to London to paint scenery for the stage of Drury Lane. All this while he was studying artistic drawing and painting, and in 1826 and 1827 he attracted the attention of the public with pictures of Rouen and Amiens cathedrals in the Royal Academy exhibitions. Then for several years he travelled in Spain, Morocco, Egypt, Palestine, Italy, Belgium, making drawings of grand and impressive buildings and landscapes with picturesque edifices, and working them up into pictures. From this work, following stand out—the drawings from Spain for the illustrations to the *Landseer Annual* (1835-38); the magnificent volumes of *The Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia* (1842); numerous interiors of churches, as *St. Miguel at Xeres*, *Holy Nativity at Bethlehem*, *St. Jean at Caen*, *St. Paul at Antwerp*, *St. Peter's at Rome*, the cathedrals of Milan and Seville; and the grandiose pictures, 'Departure of the Israelites from Egypt' (1829), 'Ruins of the Great Temple at Carthage' (1845), 'Jerusalem' (1845), 'Destruction of Jerusalem' (1849), 'Rome' (1855), and 'Grand Canal at Venice' (1856). Roberts's style is essentially spectacular, producing grand broad effects, with magnificent architectural arrangements, to which the details are of course generally lost. He was knighted in 1838, and R.A. in 1841; and died 25th November 1864. See Life by James Ballantine (1866).

**Roberts, Sir Frederick**, British general, was the son of an Indian officer, General Sir Abraham Roberts, and was born at Cawnpore on 30th September 1832. He was brought to England when two years old, educated at Clifton, Eton, Shrewsbury, and Addiscombe, and entered the Bengal Artillery in 1851. His first taste of actual warfare was got in the hot time of the siege of Delhi, during the Mutiny, and he took an active part in the subsequent operations down to the relief of Lucknow, the major-general's head quarters and the capital of the V.C. He discharged the duties of assistant quartermaster-general in the Abyssinian expedition of 1868, and in the Lashkari expedition of 1871-72. On the outbreak of the Afghan war in 1878, he was made major-general, was appointed to command the Kurrund, and occupied an important post. He forced in brilliant fashion the Afghan position on the peak of Peiwar Kotal (8500 feet above sea-level), and was rewarded with a knight-commander of the Bath (1879). After the murder of Sir Henry Rose, and the escape of the British missionaries at Kabul, he was sent the command of the force sent to avenge them. He defeated the Afghans at Charasia on 6th October, took possession of Kabul on the 12th, and assumed the government of the country, Yákub Khan having abdicated. Events followed quickly: the fortitude and devotion of Sherpur was occupied by the British army, the fortress of Balkh, then in surrender, was dismantled, Yákub Khan was sent a prisoner to India, the Afghans began to concentrate on Kabul, General Roberts sought to check them, and there was much delay, a British attack on Kandahar, which was proclaimed Assure, and General Burrows was crushedly defeated at Maiwand, and the British garrison of Kandahar besieged by the followers of Ayub Khan. On 9th August Sir F. Roberts set out with 10,148 troops, 8143 native followers, and 11,224 baggage animals on his memorable march through the heart of Afghanistan. Reaching Kandahar three weeks later, he immediately gave battle to Ayub Khan, and routed him completely, capturing all his artillery and his camp. He revisited England towards the close of the year and was honored with a baronetcy, and with a return to India he was appointed commander-in-chief of the Mudras array (1881); and in 1883-93 was commander-in-chief in India. In 1895 he was made Field-marshal Lord Roberts of Kandahar and Waterford, and commander of the forces in Ireland; he commanded in chief in South Africa in 1899-1900, and in 1900 was made a baron-in-chief of the British army. He is also C.C.S.I., L.L.D. (Cantab.), &c.

See a Life by C. R. Low (1883), but especially Lord Roberts's own work, *Forty-one Years in India* (1896).

**Robertson, Frederick William**, was born, eldest of the seven children of an artillery captain, Lieutenant William Robertson, on 1st February 1835, his first five years at Leith Fort. He had his schooling at Beverley, Tours, and Edinburgh Academy, and from the beginning was marked as an eager and imaginative child, gentle and unsuspicious, of singular purity of spirit and uprightness of character, and with an altogether unchildlike sense of the dignity of duty. After a short time of study at Edinburgh University, and a year of wearing drudgery in a solicitor's office at Bury St Edmunds, he returned to his home at Cheltenham to prepare for the army, but while awaiting his commission was applied to in a most importunate manner and of his vocation to the ministry. He matriculated at Brasenose College, Oxford, on 4th May 1857, and five days later came the offer of a commission in a cavalry regiment. At Oxford he lived a secluded life, and gave himself with fervour to the study of the Scriptures. From this time he felt no real affinity with Newmanism, but clung firmly to the Evangelicalism of his upbringing, tempered by a charity and tolerance all his own. Although he did not compete for honours, he read hard, especially in Plato, Aristotle, Butler, and Wordsworth, and admired the works of the elder Coleridge. He was ordained by the Bishop of Winchester in July 1840, and for nearly a year thereafter held a curacy at Winchester. His health now broke down at once
from over-devotion to work and a course of ascetic austerities through which, in this period of bondage to the letter, a hypersensitive conscience prompted him to seek after a higher level of Christ, and by his kicking towns on the Continent restored him to health. Masterly extended, after a short acquaintance, a daughter of Sir George William Denys. In the summer of 1842 he became curate to the incumbent of Christ Church, Cheltenham, and here for nearly five years to preach his sermons, to fight the depression of spirits, conviction of failure, and a painful and prolonged mental struggle through which he fought his way upwards to certainty in his grasp of the realities of Christian truth. His faith in Evangelicalism was first shaken by the intolerance and bitterness of its partisans, and the spiritual agony of the revolution shook his soul to its foundations, and again broke down his health. In September 1846 he set out for the Continent, and, after three months of travel and preaching at Heidelberg, returned a follower of no school to accept the curacy of St Ebbe's in Oxford. Here the power of his preaching had already made itself felt among his poor and even among the undergraduates, when in August 1847 he accepted an invitation to Trinity Chapel, Brighton. In the pulpit he was as a disciple of Christ, and his rare union of imaginative with dialectic power, the beauty and freshness of his thought, his earnestness, originality, wide sympathy, and knowledge of the human heart at once arrested public attention. He brought the reality of Jesus Christ to bear on everyday life and the perplexing social problems of the time, and pointed out the path to the true liberty, equality, and fraternity in service and discipleship as sons of God and joint-heirs with Jesus Christ. But his motives were misunderstood by many, and, especially after the excitement of 1848, he was branded for his sympathy with working-men as a revolutionist and enemy of social order, and subjected to much misrepresentation and many a cruel and unjust attack. He established the Working-men's Institute in Brighton, and taught its members how to teach their children how to read, and found himself with a passionate and chivalrous enthusiasm into every battle waged in his day against tyranny and wrong. Stern in denunciation of moral evil, he was tolerant of intellectual error, and thus his intellectual and ethical system was hitherto outside the pale of Christian sympathy. The strength and absolute sincerity of his convictions, and the broad rationality and certitude on which these were based, gave new strength to many a troubled and doubting heart, and added in almost unexampled degree the seal of power and comprehensiveness to his ministry. To him the Incarnation was the centre of all history; Christ, God's idea of human nature realised. He was no mere negative theologian, for the central point of his preaching was ever the historical reality of the life of Christ, once and for all, and the brotherhood with man. Men are sons of God by virtue of His image stamped upon them in creation; they become so de jure by baptism, but de facto by faith. The suffering of Christ makes atonement for our sins by making humanity sympathetically suffering for others; while faith converts this potentiality into an actual reality, as the foundation of union with God and the spring of Christ-like qualities within us. The characteristic fruit of faith is a pervasive love to Christ and to one another, and one of the privileges that flow from it is an elevation from the bondage of the letter, and a security in the freedom of the spirit. Hence came Robertson's honest refusal to sign the petition for an enactment against opening the Crystal Palace on Sundays—a protest against binding the chains of Judicial legalism on the Christian conscience which cost him much odium and inspired one noble sermon. Robertson grasped the idea of religious sensiveness, and the spirit of intolerance, with its unity of spirit under diversity of form, recognising that theological systems must be continually modified by new conditions of life and thought in the historical development of the ages. The intolerant spirit of absolutism is the despotism of the church, and the High Church subservience to form, as well as its search for an ideal in the Christianity of the past rather than in the present or the future, were alike repugnant to him; yet he possessed all the emotional fervour which used to be claimed as the monopoly of the one, and which he loved in his own day to recognise in the fresh enthusiasm of the other, together with the strength of thought and the philosophic breadth usually associated with the more liberal theology. He himself summed up the cardinal principles of his teaching in these propositions: (1) The establishment of pastoral truth, instead of the negative destruction of error. (2) That truth is made up of two opposite propositions, and not found in a via media between the two. (3) That spiritual truth is discerned by the spirit, instead of intellectually in propositions, and therefore Truth is more certainly to be taught actively, not dogmatically. (4) That belief in the human character of Christ's humanity must be antecedent to belief in his divine origin. (5) That Christianity, as its teachers showed, works from the inward to the outward, and not vice versa. (6) The soul of goodness in things evil.

In the pulpit Robertson's voice was low but clear and musical, with occasional startling modulations, and that peculiar thrill of suppressed emotion which is the innermost secret of eloquence. He stood almost motionless, erect, his fine face, delicate and mobile features, and deep blue eyes all eloquent in harmony with his words. Intensely sensitive as he was, all self-consciousness vanished as he spoke, his brain and heart aglow with a fire of earnestness that burned up his physical strength. He had a masterly and immaterial voice, and his sermons were a meaningless sequence of words, a slip of paper a brief abstract of the whole with merely the heads and a few of the leading thoughts. This he took with him into the pulpit, but hardly had he warmed to his subject ere it was crushed in his grasp and flung aside as useless.

During his last years Robertson suffered intense pain from a disease of the brain, which was heightened by the excitability and unrest of his temperament, and the misrepresentations that fell like blows upon a hypersensitive nervous organisation. He preached his last sermon in Trinity Chapel on 26th March 1855, but the vicar had refused on entirely inadequate grounds to confirm his nomination of a curate. After a few more weeks of cruel suffering he died, 18th August 1855, with the last words on his lips, 'I must die.' God do His work.' Eight days later he was laid in the Extra-mural Cemetery at Brighton amid the sorrow of the entire population of the town. Its citizens knew well what Stopford Brooke's biography twelve years later revealed to the wider world, that his whole life had been a passionate love to the soul of Christ.

Robertson of Brighton published in his lifetime but one sermon—the four series (1855, 1855, 1857, 1859-63) so well known over the English-speaking world, and constituting so unique a monument of religious genius, what?
not written for delivery or preservation, but are really recollections sometimes dictated by the preacher himself to the younger members of a family in which he was instructed, and written by himself for them when they were at a distance. Yet another volume, The Humus Race, &c., was issued in 1840. Other works that have also been published are Expository Lectures on St Paul's Epistles to the Corinthians (1839); Lectures and Addresses (1858); An Analysis of In Memorialis (1862); a translation from Lessing—The Education of the Human Race (1863); and Notes on Genesis (1871). The Life and Letters—the latter only in vellum to the subscribers, by the Rev. Stopford A. Brooke, appeared in 1865, and has already taken its place among the classics of English biography.

Robertson, Joseph, Scottish antiquary, was born, a small shopkeeper's son, at Aberdeen, 17th May 1804, in the Old Academy, and the grammar-school and Marischal College of his native city. An Episcopalian and Conservative, he was apprenticed to a lawyer, but took early to writing, and, after six years of literary work at Edinburgh, was a newspaper editor at Aberdeen, Glasgow, and New York through tracts, in 1833. He was in that year appointed curator of the historical department of the Edinburgh Register House, received in 1834 the degree of LL.D., and died 13th December 1866. He was an originator of the Aberdeen Spalding Club (1839–70), for which he edited the first and for forty years the publication of the Spalding Club's Encyclopaedia he wrote eighty articles (Columba, Cudlees, Cuthbert, Mary Stuart, &c.), many of which have, with revision, been retained. Of his other works may be noticed The Book of Bon Accord, or a Guide to the City of Aberdeen (1833), Catalogues of the Heads, Dresses, Books, and Possessions of Mary Queen of Scots (Bannatyne Club, 1863), the invaluable Connell Section: Ecclesie Scotiana Statuta, 1255–1559 (2 vols. Bannatyne Club, 1866), and an admirable article in the Quarterly Register for June 1840 on 'Scottish Abbeys and Cathedrals.' See the Memoir prefixed to a reprint of the last (Aberdeen, 1891).

Robertson, Thomas William, dramatist, was born at Newark-on-Trent, 9th January 1829. The family had for some generations back been actors and actresses, and young Tom was brought up almost on the boards. About the middle of the 1840's he was preparing for the stage, in which his father was connected, ceased to pay the company was broken up, and Tom proceeded to London. There he struggled for a living, acting as prompter and stage manager, writing unsuccessful plays, acting himself, writing for newspapers and magazines, was anxious to withdraw, translating French plays, and so forth; but Robertson was never an actor of any mark. His first success as a dramatist was with David Garrick, in 1864, the title role of which was one of Sothorn's great things. This was followed by the production of the comedy Society at Liverpool (1865), where, and much later in London, it was received with the warmest approval. His next comedy, Oura (1866), produced by the Bancrofts at the Prince of Wales's Theatre, London, thoroughly established Robertson's fame; and from that time his pen was kept incessantly busy. Coote (1867), Play (1868), School (1869), M.P. (1879)—all brought out by the Kendals at the Prince of Wales's—and Home (1869) and Dreams (1869), the former at the Haymarket, the latter at the Gaiety, were all equally successful. But in the midst of his triumphs Tom Robertson died, in London, on 3d February 1871. His best comedies still retain their popularity, thirty years after they were first produced. This is owing in the first place to the excellence of their construction and stagecraft, and in the next to their bright and merry humour, their wholesome, healthy tone, their happy contrasts, and the sunny spirit that shines through them. See his Principal Dramatic Works, with Memoir by his son (2 vols. 1880), and the Life and Writings, by Pemberton (1893).

Robertson, William, the historian, was born 19th September 1721, at Northwick in Midlothian, of which parish his father was minister. He went to school with Dr. Keith, at twelve entered the University of Edinburgh, and at twenty-two was ordained as minister of Glashmuir. On the sudden death of his father and mother soon after, the care of a younger brother and six sisters devolved upon him, and this duty he at once cheerfully undertook, although his income was but £200 a year. At the same time he was assiduous in preaching, in catechising, and in all the duties of his office. His vigour and patriotism he showed by joining a body of volunteers formed for the defence of Edinburgh against the Jacobite rebels in 1745, and after the surrender of the city he offered his services to the royalist commander at Haddington. As early as 1751 we find Robertson taking a prominent part in the debates of the General Assembly, and indeed his influence soon became supreme as leader of the Moderate party in the church. He was foremost in the rejection of the deposition of Glespie in the Assembly in 1752, and in 1757 the acquittal of Carlyle of Inveresk before the Synod for having been present at the performance of Home's tragedy of Douglas on the Edinburgh stage. From 1759 till his death he was joint-minister with Dr. Erskine of Greyfriars Church, Edinburgh, and in the same year he was appointed chaplain of Stirling Castle. Still further, in 1761 he became a royal chaplain, in 1762 principal of the university of Edinburgh, and in 1764 the office of king's historiographer was revived in his favour, with a salary of £200. To this time falls the magisterial patronage of the English church were held out to him, but these he was too sensible and honest to accept. All this was because of the splendid and immediate success of his History of Scotland (1753–59), which earned the warmest strangers from Hume, Horace Walpole, Lord Chesterfield, Bishop Warburton, David Garrick, and Baron d'Holbach. 'If not Dr Johnson—Sir, I love Robertson; and I won't talk of his book,' said the doctor to Boswell. Next followed the History of the Reign of the Emperor Charles V. (3 vols. 1760), to which Robertson contributed a poetic preface and Suggestive View of the State of Society in Europe from the Subdivision of the Roman Empire to the Beginning of the Sixteenth Century. This is the most valuable of Robertson's works. The field has been often since traversed by authors who have discovered much new material, but all the use they have made of it has become an indirect tribute to the natural sagacity of Robertson. He received £4500 for the copyright, and was gratified by the most flattering praises from Voltaire and Gibbon. The History of America appeared in 1771; An Historical Dissertation concerning the Knowledge which the Ancients had of India in 1791. Robertson died near Edinburgh, 11th June 1793, and was buried in the Greyfriars churchyard.

Robertson's Histories are still excellent reading, although in every case they have been left behind by the more valuable works of a later day. Their merit is great, considering the slenderness of the materials then available and the fact that he lived almost half a century before the modern conception of the scope and method of history awoke. None of his contemporaries philosophised on defective data with such success as he did within the limitations of 18th-century limitations; but it is true that many of the remarks in his review of the state of Europe display a quite remarkable sagacity and power of generalisation. His style is clear and correct, but is formal, and lacks idiomatic vigour and spontaneity.
ROBERTSON

See the short account of his life by Dugald Stewart; Carlyle's Autobiography; Brougham (a grand-nephew, who, a boy of fifteen, had stood beside the historian's ghost), Lives of the Members of the House of Time of George III.; and Lord Cockburn's Memorials of his Life and Times, for an interesting sketch of his appearance and conversation in his last years.

Robertson, REV. WILLIAM BRUCE, D.D. (born 24th May 1829, died 27th June 1880), always called to his feet as a Scotchman, was ordained to the United Presbyterian church there in 1843. As a student he had spent many hours with De Quincey, and largely owing to his advice had finished his theological course and entered the Church. Serious illness in 1871 incapacitated him from resuming regular work. Between 1871 and 1878 he was much in Italy. Thereafter he was able to undertake occasional preaching, his sermons and week-day lectures at Cambridge, 1879-81, being the most memorable. Possessed of a strong sense of humor, he could make it serve the highest ends, or could pass at once without effort or jar to the most solemn subjects. Gifted with a striking presence and a sonorous, well-regulated voice, Calvinist in doctrine, but catholic in sympathy; a staunch Presbyterian, but with a keen eye for artistic beauty of cathedrals; an ardent admirer of Luther, but a loving student of the liturgy and hymns of the Roman Church; a seer rather than a theologian, he made music and painting, sculpture and architecture all minister by illustration and analogy to the evangelical teaching of the gospel and the cross of Christ. Unfortunately he published nothing beyond a translation of the Dies Irae and one or two sacred songs.

For other poems and jetting of a few of his sermons, see his Life, by Rev. James Brown, D.D. (1889); and Robertson of Irvine, the Poet Preacher, by A. Guthrie (1889).

Robes, MISTRESS OF THE. See HOUSEHOLD.

Robespierre, Maximilien Marie Isidore, was born of a legal family, originally of Irish origin, at Arras, 6th May 1758. His mother died in 1767, his broken-hearted father two years later, and the four children were brought up by their maternal grandfather, an Arras brewer. Maximilien, the eldest, early showed unusual promise, and was educated at Arras and at the Collège Louis-le-Grand at Paris, where Camille Desmoulins was a fellow-student. He was admitted avocat in 1780 to the Solicitors' Court, and was named criminal judge by the bishop of Arras, but resigned his place soon after to avoid passing a sentence of death. All through life a fanatical devotee of the gospel according to Rousseau, his sentimentality and taste for verses made him popular among the Bowo's at Arras. He drew up the cabier or list of grievances for the guild of cobblers, and was elected to the States-General in 1789 as one of the deputies for the tiers état of Artois. He soon attached himself to the extreme Left—the 'this momentous question of the execution of a popular idol—, it was not long before his earnestness and his high-sounding phrases commanded attention. That young man believes what he says; he will go far," said Mirabeau, forecasting his future with the divination of genius. Indeed his influence grew and developed itself in the Assembly, and thousands amongst the mob of patriots outside became fanatical in their admiration of his sincere cant and his boasted incorruptibility. Three days after the death of Mirabeau he called upon the Assembly to prevent any deputy from speaking for the execution of the King. This motion in the following month (May 1791) carried the motion that no member of the present Assembly should be eligible for the next. This policy grew out of the narrow and acid suspicionfulness of his own nature, and reveals the inherent meanness of his aims and his failure to grasp that grand idea of real parliametary government by a responsible ministry, which had been the dearest dream of Mirabeau.

Next followed Robespierre's appointment as public accuser, the king's flight to Varennes (June 18th), Lafayette's last effort to control the sacred right of Insurrection on the Champ-de-Mars (17th July), the abject terror of Robespierre, his sheltering himself in the house of Duplay, a carpenter, his hysterical appeal to the Club, the trial of the club, the verdict by every member to defend his life, and his being crowned by chaplets, along with Pétion, and carried home in triumph by the mob at the close of the Constituent Assembly (30th September).

After seven weeks of quiet he sold his small property and returned to Paris, to the house of Duplay, where he remained to the last day of his life. He was much beloved in the family, and a passion quickly sprang up betwixt himself and his host's eldest daughter Éléonore, a romantic girl of twenty. The house was a charming village in which he worked and slept; it contained a few busts and portraits of himself. Alone amongst the patriots he was noted for the carefulness of his dress, which never varied in the slightest—powdered hair, a bright blue coat, white waistcoat, short yellow breeches, white stockings, white buckles. Small and feeble in frame, solitary and reserved in habits, he ever wore an anxious look upon his strained and spectacle face; his complexion was atrophical, even verdâtre; and he retained to the last the sobriety of the cynic, drinking only water.

Meantime the Girondist party had been formed in the new Legislative Assembly, its leaders—the loudest, Brissot—eager for war. Robespierre, who ever feared and disliked war, offered a strenuous opposition in the debates of the Jacobin Club, and sometimes, if sedentary, in his endless and witty harangues rose into the region of real eloquence. Fundamentally an empty pedant, inflated with words which he mistook for ideas, in his orations he is ever riding in the air on theories, his foot never on the solid ground of the practical. In April 1792 he wrote to his paper, the National Monitor. He was invisible during the crisis of the 10th August, but he joined the Hôtel-de-Ville faction, and on the 16th August we find him presenting to the Legislative Assembly its petition for a Revo- lutionary Tribunal. He was appointed to it, but did not appear, however, that he was in any sense directly responsible for the atrocious September massacres in the prisons, or more than a mere accessory after the fact. For his reward he was elected first deputy for Paris to the National Con- vention, which opened on the 21st September. The bitter attacks upon him by the Girondists were renewed only to throw Robespierre into a closer union with Denton and his party, but the final struggle was interrupted for a little by the death and defenestration of the king. Robespierre opposed vigorously the Girondist idea of a special appeal to the people on the king's death, and his execution (21st January 1793) opened up the final stage of the struggle, which ended in a complete triumph of the Jacobins on the 2d June of the same year. The Committee of Public Safety—a permanent Cabinet of Revolution—was decreed in April 1793, but Robespierre was not elected till the 27th July. He was now for the first time one of the actual rulers of France, but it is open to question whether for the whole twelve months from this time till the (3d Paris) Pétition, and not merely the stalking-horse for the more resolute party within the Twelve. His vaunted respect-ability, his great popularity with the mob, and his
gift of fluent, if vague and windy, oratory made an admirable cover for the treacherous designs of strong and completely unscrupulous men like Billaud-Varennes and Collot d'Herbois, and at least it is certain that, contrary to what Saint-Just believed, the only members whose political and social ideals coincided with his own, destitute of political intuition, without foresight or sagacity, himself the mere dupe of a few borrowed phrases, he was strong because within his narrow limits he was honest, and because he probably had a horizon of social ideals, not nakedly identical with his own advantage. He was astute enough, moreover, to play off one force against another—the Convention, the Commune, and the Committee, while he derived his strength from the constant worship of the Club.

The next scenes in the great drama of Revolution were the dark intrigues and desperate struggles that sent Hébert and his friends to the scaffold on the 24th March 1794, and Danton and Robespierre's school-fellow, Camille Desmoulins, on the 5th of May. Robespierre's most long disliked, and Channette's crazy dedication of the Goddess of Reason had filled him with disgust; Danton he at once hated and feared with that fierce and spiteful hatred he ever felt instinctively for men like the great Tribune and Vergniaud with never a secret of his room could follow me: I drag down Robespierre," said Danton with prophetic truth. The next three months he reigned supreme, but his supremacy prepared the way for his inevitable fall. He nominated all the members of the Government Committees, placed his creatures in all places of influence in the commune of Paris, sent his henchman Saint-Just on a mission to the armies on the frontier, assumed supreme control of the Revolutionary Tribunal, and completely revolutionised its method of operation by the atrocious measure introduced by his creature Cu ó thon on the 22d Priial (10th June), to the effect that neither counsel nor witnesses need be heard if the jury had come otherwise to a conclusion. The fatal significance of this change—a complete abrogation of all law—is seen in the fact that from this time till the day of Robespierre's death, the daily tale of victims that were sacrificed averaged almost thirty. But, in accordance with the law that governs all human things, as Robespierre's power increased his popularity decreased, and still further he had committed the fatal folly of making himself publicly ridiculous. Already his speech, on the 26th March, had excited derision and resentment, but his declaration on 7th May of a new religion for the state—the foundation of a new regime of public morality—awakened in the mind of Paris the numbing sense of humour.

The Convention at Robespierre's instance agreed to compliment the Supreme Being with an acknowledgment of His existence and themselves with the Consolatory Principle of the Immortality of the Soul, to be celebrated in thirty-six annual festivals. The first of these was held on the 8th of June, when Robespierre, glorious in a new violet-blue coat, walked in front of the procession and delivered his soul of a vast harangue, and sent fire to paste-board figures representing Atheism, Selfishness, Annihilation, Crime, and Vice. An old mad woman named Catherine Theot, who thought herself the mother of God, now declared Robespierre to be the new divine Sophia, and her claim was drawn upon him still further ridicule in the Convention. Meanwhile the pace of the guillotine grew faster, although apparently Robespierre hoped to bring it to a close as soon as all his more dangerous enemies, like Danton, Fouché, and Valère, were cut off. Meanwhile the public finance and the work of government generally drifted to ruin, and Saint-Just openly demanded the creation of a Dictatorship in the person of Robespierre as alone possessing intellect, energy, patriotism, and revolutionary experience enough. On the 26th July with the 8th of May, the 5th October, and the 1st February, the Dictator delivered a long harangue complaining that he was being accused of crimes unjustly. He was listened to in deep and unsympathetic silence, and the Convention, after at first obstinately passing his decrees, next rescinded them and referred his proposals to the committees, and the sitting ended without anything being concluded. That night at the Jacobin Club his party again triumphed, and the Tallien party in despair hurried to the members of the Right, the Girondist remnant, and implored their help against the common enemy of the Jacobins. In this distress the Convention Saint-Just could not obtain a hearing. Tallien, Billaud-Varennes, and Vadier vehemently attacked Robespierre, and the voice of the Dictator himself was drowned with cries of 'Down with the tyrant!' 'Turning to the Right,' I appeal to you whose hands are clean,' he cried, but the Right sat in stony silence. 'President of Assassins, I demand to be heard,' he cried, but his voice died down in his throat.—'The blood of Danton chokes him,' cried Garnier. An unknown deputy named Louchet proposed that Robespierre should be arrested, and that after the Convention Saint-Just should follow him. His younger brother and Lebas demanded to be included in the honourable sentence. Vain attempts were made by the Jacobin Club and the Commune to save their hero, but Paris refused to move, and even Henriot's artillerymen to obey. Robespierre broke his arrest and flew to the Common Hall, whereupon the Convention at once declared him out of the law. The National Guard under Barras turned out to protect the Convention, and Robespierre had his lower jaw broken by a shot fired by a grenadier named Merda, or, as many believed, by his own hand. Next day (28th July; 10th Thermidor 1794), still in his sky-blue coat, the miserable, trembling wretch died with Saint-Just, Couthon, and nineteen others by the guillotine; the day after seventy-one members of the municipality followed, twelve more on the third day, and the Reign of Terror still kept the guillotine going.

See the histories of the Revolution by Lamartine, Michelet, Louis Blanc, Carlyle, von Sybel, H. Morse Stephens, and M. Taine; the life by G. H. Lewes (1849); and especially Ernest Havel's exhaustive and authoritative work (28th July; 10th Thermidor 1794) (5 vols. 1850–67), also his Thermidor (1891).

Robin. See Redbreast. The American Robin is a Thrush (q.v.)—the Turdus migratorius; and the name of Golden Robin is sometimes given to the Baltimore Bird (q.v.).

Robin Goodfellow. See Puck.

Robin Hood, the hero of a group of old English ballads, represented as an outlaw and a robber, but of a gallant and generous nature, whose familiar haunts are the forests of Sherwood and Barnsdale, where he flees the time carelessly in the merry greenwood. He is ever genial and good-natured, religious, respectful to the Virgin and to all women for her sake, with a kind of gracious and noble dignity in his bearing. He lives by the king's deer, although personally most loyal, and wages ceaseless warfare on all proud bishops, abbots, and other ecclesiastics, and shows no respect for any right of property, distributing the spoil liberally to the poor and to all honest men in distress, of whatever degree. He is univalved with the bow and quarter-staff; but in as many as eight of the extant ballads comes off the worse in the combat with some stout fellow, whom he thereupon in desperation joins his company and the comrades are Little John, Sothelok (Scarlet), and
Much; to these the Gest adds Gilbert of the White Hand and Reynold. A stalwart curial friar, called Friar Tuck in the title though not in the ballad, fights with Robin Hood, and apparently accepts the invitation to join his company, as he appears later in two broadsides, which also mention Maid Marian. Such is the romantic figure of the greatest of English popular heroes—a kind of yeoman-counterpart to the knightly Arthur.

The earliest notice of Robin Hood yet found is that pointed out by Percy in Fiers Poeaman, which, according to Skeat, cannot be older than about 1377. Heming says in his almanac that, though but little acquainted with his patronetem, he knows 'rymes of Robyn Hode and Randolf, erie of Chestre.' In the next century we find him mentioned in Wyntoun’s Chronicle of Scotland (c. 1420); a petition to parliament in the year 1459 represents a broken man in Derbyshire taking to the woods 'like as it hadde be Robyn-hode and his meyned;' Bower, in his Scotochronicon (1441-47), describes the lower orders of his time as entertaining themselves with ballads both merry and serious about Robin Hood. Little is known of his mates, and preferring them to all others, Major and Mair (c. 1470-1500) says in his Historia Maioris Britanniae that Robin Hood ballads were sung all over Britain. The last passage gives apparently the earliest mention of those more romantic and religious ballads in which Robin Hood earned for himself a place in Fuller’s Worthies of England, under his proper county, sweet Nottinghamshire, 'not for his thievry but for his gentleness.' Yet another 15th-century mention occurs in the Paston Letters, where Sir John Paston writes in 1475 of a servant whom he had to play Robin Hood and the Sheriff of Nottingham.

Fragments of two Robin Hood plays exist, one dating from 1475, the other printed by Copland with the Gest about 1550. The latter is described in the title as 'very proper to be played in May-games.' Robin Hood was a popular figure in these, and during the 16th century, as we find from Stow, Hall, and other writers, and there is evidence that in this connection he was known as far north as Aberdeen. In place-names again we find traces of his home, his lair, his killers, his cairns, caves, and oaks from Somerset to Whithy. In the Gest the localities around Barnsdale are topographically correct, down to the place of his death at the priory of Kirkless between Wakefield and Halifax. Here the valiant outlaw is treacherously killed by his Kinswond, and the last charge to Little John is completely true to his character, and is expressed in lines of touching simplicity:

Lay me a green sod under my head, And another at my feet; And let me have my bow by my side, Which was my muse sweet; And make my grave of gravel and green, With my bow on my right hand.

There is no evidence worth anything that Robin Hood was ever more than a mere creation of the popular imagination, but in due time the yeoman became a political personage, and was transformed into an Earl of Huntingdon for whom a suitable pedigree was constructed. Both Sir Walter Scott, in Ivanhoe, and Sir Harry, in The Forest of the Tytere, make him a Saxan chief holding out like Hereward against the Normans; Bower, the continuator of Fordun, distinctly calls him one of the proscribed followers of Simon de Montfort; Joseph Hunter (1832) makes him an adherent of the Earl of Lancaster in the civil war. Finally, the scholar discovered a still further and exceptionally amusing mare's nest in the name of one Robin Hode, who entered the service of King Edward II. about Christmas 1323 as one of the 'valets, porteurs de la chamber,' and was eleven months later found unfit for his duties, and paid off with a gift of five shillings. 'To detect 'a remarkable coincidence between the ballad and the recorded requires,' says Professor Child, 'not only a theoretical prepossession, but an uncommon insensibility to the ludicrous.' Kuhn again identifies our outlaw with Woden; others with a sun-god, a woodland deity, and the like—all which subtleties of speculation are unnecessary if we readily admit that the hero of popular creative imagination may well have formed a peg round which to hang much old-world wood-lore even then fast fading into forgetfulness.

Of Robin Hood ballads there have come down to us in more or less ancient form as many as forty, of which eight may be said to be of the first importance, and more besides 'are the finest quality of ballad poetry. Of the remaining thirty-two, as Professor Child points out, about half a dozen have in them something of the old popular quality; as many not more than the least snatch of it. Fully a dozen are variations of the themes given above, sometimes sickening upon the theme 'Robin Hood and his Match.' The best of all the cycle are perhaps 'Robin Hood and the Monk,' and 'Robin Hood and Guy of Gisborne,' and both open with a delightful glimpse of the green wood a century and more before Shakespeare wrote his English poetry—

In some, when the shawe shewezy, And leaves be large and long, Hit is full merry in fayre forest To here the foulys songe.

To see the dore draw to the dale, And leve the killes hee, And shadow here in the Ives grene, Under the greene-woode to lye.

The second begins no less beautifully—

When shawe bene shene, and shreds full fayre And leveis both large and longe. Ite is merry, walking in the fayre forest, To heare the gryse songe.

The Lytell Geste of Robyn Hode was printed by Wynken de Wordre, most probably before 1500, a long poem of over 1800 lines, arranged in eight fyftes, being a not unskillful reduction of at least four earlier distinct ballads.

See Ritson’s collection of Robin Hood ballads (2 vols. 1793); J. M. Fellowes, The Lytell Geste of Robin Hode (2 vols. 1847); the Percy Folio Manuscript, vol. i. (1867), and the Introduction to the Robin Hood ballads there by Professor Hales; and especially part v. (Boston, 1888) of Professor Child’s Manual English and Scottich Ballads. The first known ‘Garland’ was printed in 1670, and in 1678 there appeared a prose version of it, reprinted by W. J. Thomas in his Early English Prose Romances (vol. ii. 2d ed. 1889).

Robin Hood’s Bay, a fishing-village in the North Riding of Yorkshire, 63 miles SE. of Whitby by the coast railway to Scarborough, opened in 1882. The bay on which it stands is picturesque fringed by lofty cliffs, rising in the Old Peak, its southern horn, to a height of 385 feet. It owes its name to traditions of Robin Hood, whose arrows shot from the tower of Whitby Priory reached Hawsker, 3 miles distant.

Robinia, a genus of trees and shrubs of the natural order Leguminosae, sub-order Papilionaceae. The most important species is the Locust Tree (q.v.), also known as the False Acacia, or Thorn Acacia, often simply designated Acacia. It is a native of North America, extending from Canada to the southern states, and is there much valued for the hardness and durability of its timber. With it, it is alleged, are the Pilgrim Fathers were, and the city of Boston founded. When green it is of soft texture, but when mature and seasoned it rivals the oak for strength and

ROBINIA 749

ROBINIA
The life of Benjamin Robins, mathematician, who was born at Beverley, was not an easy one. Robins, born in 1707, the native but time, London, splendid fortification, had 1734 Palestine, gunnery, Goethe, congrega—which In In had 1608 his middle-. 760 and suffers front. The flowers are in many hut, in large pendulous racemes. In San Domingo its flowers are used for making a distilled liquor and a syrup. The roots throw up many suckers, and are very sweet, affording an extract resembling liquorice. — *R. viscum* is a smaller tree, but even more ornamental, a native of the south-western parts of the Alleghany Mountains. It has rose-coloured scentless flowers. The young branches are viscid. — The Rose Acacia (*R. hispida*) is a native of the south-western ranges of the Alleghanies, and is a highly ornamental shrub, with hispid branches, and large rose-coloured scentless flowers.

Robins, Benjamin, mathematician, the father of the military art of gunnery, was born at Beverley, in a poor Quaker family. Having obtained a little instruction in mathematics, he prosecuted this branch of science with great zest, and, having removed to London, set up for a teacher of mathematics, and published several mathematical treatises which procured him considerable reputation. Robins next commenced his great series of experiments on the resisting force of the air to projectiles, varying his labours by the study of fortification, and invented the Ballistic Pendulum (q.v.). In 1734 he demolished, in a treatise entitled *A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions*, the objections brought by the celebrated Berkeley, Bishop of Cloyne, against Newton’s principle of ultimate ratios. His great and valuable work, the *New Principles of Gunnery*, upon the preparation of which he laboured most assiduously and for a long period, he published in 1742, and produced a complete revolution in the art of Gunnery (q.v.). In consideration of his able defence of the policy of the then government, by means of pamphlets which he wrote and published from time to time, he received, on 17th of May, 1746, the degree of Engineer-in-general to the East India Company; but his first undertaking, the planning of the defences of Madras, was no sooner accomplished than he was seized with a fever, and he died July 29, 1751. His works were collected and published in 1761.

Robinson, Edward, philologist and biblical scholar, was born at Southington, Connecticut, April 10, 1794, graduated at Hamilton College, New York, in 1816, and there resided till 1821, when he went to Andover, Massachusetts, to see through the press an edition of part of the *Hebrew*. Here he studied Hebrew under Professor Stuart, but in 1820 went to Germany, where he studied under Gesenius and Neander, and married as his second wife Jakob von Jakob, sister of a professor at Halle. In 1830 he became extra-ordinary professor of Sacred Literature at Andover, in 1837 professor of Biblical Literature in the Union Theological Seminary, New York. He now made an extensive survey of Palestine, collecting materials for his *Bible in Palestine and Adjacent Countries* (3 vols. 1841). A second visit in 1852 yielded fruit for its second edition (1856). Robinson died in New York, 27th January 1863.

His other works are a translation of Uttmann’s *Greek Grammar* (1832); *Greek and English Lexicon of the New Testament* (1836; 1856); *Harmony of the Gospels*, in Greek (1845), and in English (1846). He was also editor of the *Biblical Repository*, *Bibliotheca Sacra*, *Robinson’s Dictionary*, and a translation of Gesenius’s *Hebrew Lexicon*.

His wife, Therese Albertine Louise von Jakob, well known to the world of letters as ‘Talvi,’ a name composed of her initials, was born at Halte, January 26, 1767. At ten she went to Kirchberg, Hanover, where her father became Professor, but in 1810 they removed to St Petersburg. In 1816 they returned to Halle, and here she studied Latin, and wrote her volume of tales, *Psyche* (1825). As ‘Ernest Berthold’ she published translations of Scott’s *Black Dwarf and Old Mortality*. She was a contributor of songs, *Volkslieder der Serben* (1822–26). In 1828 she married Robinson, and in 1830 accompanied him to America. After his death she lived mostly at Hamburg, where she died 13th April 1869.

Robinson, Henry Crabb, born of middle-class parentage at bury St Edmunds on 13th May 1775, was educated there and in Dublin, and then was articled to a Colehester attorney (1790–95). He studied five years at Jena, Weimar, &c. (1800–5), making friends or acquaintances of nearly all the great German spirits of the day, and during 1807–9 was engaged on the *Times*—in Spain, and the correspondent at Madrid. In 1813, at the age of thirty-eight, he was called to the bar, from which, having risen to be leader of the Norfolk circuit, he retired in 1828 with £500 a year. In looking back on his life, Mr Robinson used to say that two of the wisest acts he had done were going to the bar and quitting the bar. Thenceforth he lived chiefly in London, with frequent tours both at home and abroad till 1863, giving and receiving much hospitality, until at the ripe age of ninety-one he died unmarried on 5th February 1867. A dissenter and a Liberal, he was one of the founders of the London University (1828), an early member of the Athenæum Club (1824). Withal he was a splendid talker, who ‘talked about everything but his own good deeds,’ a buoyant companion, an earnest thinker, a prodigious reader, content not to publish but to keep a diary. ‘I early find,’ he says, ‘that I cannot use the literary faculty to give my place among English authors as I should have desired; but I thought that I had an opportunity of gaining a knowledge of many of the most distinguished men of the age, and that I might do some good by keeping a record of my interviews with them. ‘This’ he says, ‘was not quite true, I want in an eminent degree the Boswell faculty; still, the names recorded in his great work are not so important as Goethe, Schiller, Herder, Wieland, the Duchesses Amelia and Louisa of Weimar, Tieck, as Madame de Staël, La Fayette, Abbe Grégoire, Benjamin Constant, as Wordsworth, Southey, Coleridge, Lamb, Rogers, Hazlitt, Mrs Barbauld, Clarkson, &c., &c., for I could add a great number of minor stars. And yet what has come of all this? Nothing. What will come of it? Perhaps nothing.’ Yes, something has come of it—the three delightful volumes, edited in 1869 by Dr Smillie, of his *Diary, Reminiscences, and Correspondence*, which will last as long as literature itself.

Robinson, John, pastor of the Pilgrim Fathers, was born, probably in Lincolnshire, about 1575, was a Fellow of Corpus Christi, Cambridge, and ministered to a church near Norwich. He was summoned to his Puriﬁc¬tion of Fire in 1594 by Sir Philip Sidney. In 1604 he resigned his fellowship and all connection with the Church of England, and gathered a congrega¬tion of dissenters at Gainsborough. He was afterwards a minister at Scrooby, but in 1608 he and his flock escaped to Amsterdam; in 1609 he passed to Leyden, and there in 1611 he established a
church, and in 1613 met Episcopius, Arminius' successor, in debate. In 1620, after a memorable sermon, he saw the younger members of his congregation set sail in the Speedwell (which vessel they afterwards changed for the Mayflower). He himself intended to go, but the ship which he was to sail in 1631 did, follow them to Massachusetts. He died at Leyden in March 1625. His works, with a memoir by R. Ashton, were collected in 3 vols. (London and Boston) in 1831. In 1891 a large bronze tablet to his memory was placed by the American Congregational Society on the house of Peter's, Leyden, in one of whose vaults he is buried.

Robertson, Mary, poetess, born at Leamington, 27th February 1857, resided long in Italy, and in 1888 was married to M. Darmesteter, the French Orientalist, and became a resident in Paris. Amongst her poetic works are A Handful of Honeycombs (1878), a translation of Euripides' Hippolytus (1881), The New Arcadia (1881), Songs, Ballads, and a Play (1886). She has also written Lives of Emily Brontë (1883) and Margaret of Angoulême (1880), and a historical work, The End of the Middle Ages (1889).

Robinson, John, was born at Boghill in Stirling, the son of Mr. John Robinson, a Glasgow grammar-school and university. He devoted himself early to physical science, became acquainted with James Watt and Dr Black, and succeeded to the latter's chair on his transference to Edinburgh in 1766. Four years later he went to Russia as secretary to Admiral Knowles, who had been appointed president of the Russian Board of Admiralty. In 1774 he accepted the chair of Natural Philosophy at Edinburgh, but he made an indifferent lecturer, and disliked experiments. He died January 28, 1805. His Elements of Mechanical Philosophy was edited by his brother-in-law Sir Walter Scott (4 vols.) and was followed by proof of a Conspiracy against all the Religious and Governments of Europe, carried on in the Secret Meetings of Freemasons, Illuminati, and Reading Societies (1797) is a lasting monument of fatuous credulity.

Rob Roy (Gaelic, 'Red Robert'), the Scottish Robin Hood, was born in the year 1671, the son of Lieut.-colonel Donald Macgregor of Glenlyon. Till 1661 the 'wicked clan Gregor' had for more than a century been constantly pursued with fire and sword; the very name was proscribed. But from that year until the Revolution the severe laws were less harshly inflicted against them, and Rob Roy, who married a kinswoman, Mary Macgregor, lived quietly enough as a grazier on the Braes of Balquhidder. From youth, however, he was a master of the claymore, the uncommon length of his arms giving him much advantage, for without stooping he could strike the gauntlets of his Highland hose, 2 inches below the knee. Then his herds were so often plundered by 'broken men' from the north that he had to maintain a band of armed followers to protect both himself and such of his neighbours as had been driven into exile. And so with those followers, espousing in 1691 the Jacobite cause, he did a little plundering for himself, and, two or three years later having purchased from his nephew the lands of Craigsroyston and Inversnaid, laid claim thenceforth to be chief of the clan. In consequence of losses incurred he was poitoned at Balquhidder by orders of the Duke of Montrose, his lands were seized, his houses plundered, and his wife shamefully used, turned adrift with her children in winter. Maligned by these misfortunes, Rob Roy gathered his clansmen (1722), and for a time their fortune was turned; the Duke of Montrose was bewildered and deserted; aided by the red-coats they called to their aid from Dumbarton and Stirling; besides, Rob Roy enjoyed the protection of the Duke of Argyll, having assumed the name Campbell, his mother's. Late in life he is said to have turned Catholic, but in the list of subscribers to the Episcopalian church history of Bishop Keith occurs the name 'Robert Macgregor atties Rob Roy.' The history came out in 1734, and on the 23th December of that same year Rob Roy died in his own house at Balquhidder, with the Olympic Theatre of London, where he attracted large audiences for years by his representations in comedy, farce, and burlesque. An actor of original genius, Robson excelled in parts that were grotesque, eccentric, quaintly humorous or droll; he was particularly effective in sudden transitions from comicality to pathos, and the reverse, and in the delineation of violent and tumultuous passion. He gave a vivid portrait of the street outcast as Jen Baggs in the Wandering Minstrel, in which he portrayed the once notorious thug, 'Vilkins and his Dinah.' He burlesqued Macbeth and Shylock, uniting in his playing the ludicrous and the terrible. One of his principal characters was Desmaretas, a spy of Fonchés, a shabby-looking, fawning, cunning, malicious old man in the play Pied and Passion. Others of his strongest impersonations were as the dwarf in Planché's Yellow Dwarf, the Doge of Durlato, Daddy Hardlare, Sampson Burr, and Uncle Zachary in Peter and Paul. He died 12th August 1864. See Dutton Cook in Gentleman's Magazine (1882), and G. A. Sala in Atlantic Monthly (1863).

Robur, a flameless explosive, composed of chlorinated dinitro-benzene mixed with sufficient ammonium nitrate to completely oxidise it.

Roc, or Rukh, a fabulous bird of immense size, able to carry off an elephant in its talons. The idea is familiar in the East, and every reader will remember it in the Arabian Nights' Entertainments. Coloured birds were pointed out at Peshawir in the forefrounds of the Raphia (q.v.), palms were brought from Madagascar as roc's feathers. Mythical birds of similar size and strength were the Arabian 'a'knka and the Persian simurgh. The emur or simurgh was an older Persian supernatural bird; the Indian garuda, which became the symbol of Vishnu. It has been suggested, without good grounds, that the legends of the roc might have originated in traditions of extinct birds of great size, like the
Dinonius or Ephorinis, which, however, could not fly.

Rocambole (*Allium scorodoprasum*), a plant of the same genus with garlic, onion, leek, &c., and nearly allied to garlic, which it resembles in having a bulb in all its parts. The root forms rounder cloves than those of garlic, and of much milder flavour; the umbels are also bulbliferous. Rocambole has long been cultivated in kitchen-gardens. It is a native of sandy soils in Denmark and other countries near the Baltic.

**Rocella.** See **Archila**.

**Rocha,** a southern department of Uruguay, on the coast, with Business hill; thinly inhabited, in the north a swamp.

**Rochambau.** **Jean Baptiste Donatien de Vimeure, Comte de,** was born at Vendôme, 1st July 1729, entered the army in 1742, was at the siege of Maastricht, and distinguished himself at Minorea in 1756. In 1780 he was sent out in command of an army of 6000 men to support the Americans, and in 1781 he rendered effective help at Yorktown. He became marshal in 1791, and in 1804 Napoleon made him a grand officer of the Legion of Honour. He died 10th May 1807. See his *Mémoires* (2 vols. 1836; Eng. trans. 1838).

**Rochdale,** a thriving manufacturing town of Lancashire, a municipal, parliamentary, and county borough, on the Roch, 11 miles N. by E. of Manchester and 292 NW. of London. St Chad's parish church, on an eminence approached by a flight of 122 steps, dates from the 12th century, but is mainly Perpendicular in style. It is a handsome edifice, on which £10,000 was expended in 1884–85. The town-hall, erected in 1866–71, is a very fine Domestic Gothic building. The town besides has an infirmary (1883), a free grammar-school, founded in 1565 by Archbishop Parker, and rebuilt in 1840, a free library (1834), a post-office (1875), public baths (1858), a bronze statue of John Bright (1891), and a public park of 12 acres. Still, many as are the improvements in the architectural and sanitary condition of Rochdale within recent years, it is beautiful only in site, and derives its importance chiefly from its extensive and varied manufactures. The growing of wool was added a trade in woollen goods in the days of Elizabeth, when cotton goods also were sold here, and coal-pits worked. Under the Stuarts the woollen manufacture was in full activity; but it was not till 1760 that John Street, cotton-mill, was built, in which in 1862 the father of John Bright began his career as a weaver. Flannels and calicoes are now the staple manufactures, but there are also cotton-mills, foundries, ironworks, machine-shops, &c. Rochdale is the birthplace of Co-operation (q.v.), and the membership is very large.

Pioneers' Society (1844) has increased from 28 to over 11,000, with an annual business representing more than a quarter million. Since 1832 Rochdale has returned one member to parliament, and in 1856 it was incorporated as a municipal borough. The latter in 1797 was made co-terminous with the parliamentary borough, whose boundary had been extended in 1867. The manor of Rochdale (*Rcedaram in Domusdaiy*) was originally held by the Laeys of Pontefract, and through their descendants, the Dukes of Lancaster, passed to the crown. In 1692 it was sold to Sir John Byrom, whose descendant, the poet Lord Byron (of Rochdale), sold it in 1823. Pop. of parliamentary borough (1851) 29,195; (1891) 71,498. See the history of the parish by Fishwick (1889).

**Rocher.** Sir *Boyle* (1743–1807), an Irish built-making M.P., created a baronet in 1782.

**Rochefort,** Henri, whose full style in Victor Henri, Comte de Rochefort-Luay, a stormy-petrel of French politics, was born in Paris, 29th July 1832. He studied medicine, and became a clerk in the hôtel-de-ville, but was enrolled for recruiting and now exists entirely upon journalism, contributing to the *Charivari*, the *Figaro*, and other papers, until in 1868 he started his own notorious weekly, *La Lanterne*, which was quickly suppressed by the government. To avoid fine and imprisonment Rochefort fled to Brussels, but returned in 1869 on his election to the Chamber of Deputies for Paris. He now started the *Marseillaise*, in which he renewed his bitter attacks on the imperial regime. One consequence of the cowardly murder of its contributor, Victor Noir, by Prince Pierre Bonaparte, was the suppression of the newspaper. The fall of the empire gave him his release, and opened up a role for the frothy rhetorician in the government of National Defence. In February 1871 he was elected by Paris to the National Assembly, and soon made public his Communism in the pages of *Le Mote d'Ordre*. As soon as he foresaw the end of the Commune, about the middle of May, he left his duces and comrades to their doom, and made his escape from Paris. But the Prussians caught him at Meaux and sent him to Versailles, where he was sentenced to imprisonment for life. Latter he was sent to New Caledonia, whence he escaped in 1874. In London and Geneva he tried to revive the *Lanterne* and influence the Parisian press, but at length he was enabled to return by the general amnesty of 11th July 1880. In his newspaper, *L'Intransigeant*, he showed himself as impracticable as ever, but in the National Assembly (1885–86), took up Boulangerism, and returning to France in 1895, published *The Adventures of My Life* (1896; Eng. trans. abridged, 1896).

**Rochefort-sur-Mer,** a French seaport, naval arsenal, and fortress of the first class, in the department of Charente-Inférieure, stands on the right bank of the Charente, 9 miles from its mouth, and 18 miles SSE. of Rochelle, 89 SW. of Poitiers. It was founded in 1663 as a naval station by Colbert, Louis XIV.'s minister, and fortified by Vauban, being covered now on the sea side by strong forts; and it is a well-built place, with which few French towns can compare for the number and importance of its public works. The most celebrated of these is the naval hospital (1783–88), with nearly 1300 beds, and an artistic well 2758 feet deep. There are both a naval and a harbour, both open to sea, the latter with three basins; and Rochefort besides possesses rope-walks, cannon-foundries, and other establishments for the manufacture and preservation of naval stores and marine apparatus of every kind. From 1777 till 1822 it was the seat of a great convict prison. Napoleon meant to take ship for America at Rochefort, but instead had to surrender to Captain Maitland of the *Bellerophon*, 15th July 1815. Pop. (1872) 26,619; (1891) 28,866. See Vinat and Fleury's *Histoire de Rochefort*.

**Rochefoucauld.** See **La Rochefoucauld**.

**Rochefjaquelein.** See **La Rochefjaquelein**.

**Rochelle,** a seaport and second-class fortress of France, capital of the department of Charente-Inférieure, on an inlet of the Bay of Biscay, formed by the islands Ré and Oleron, and descends to the SW. of Paris. Its harbour, which consists of a outer tidal basin and an inner wet-dock, is still sheltered by the remains of Richelieu's famous dyke, and is surrounded by fine quays, close to which lie the principal streets and squares. Many of the houses are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. The most
noteworthy public buildings are the hôtel-de-ville (1486-1607), the palais-de-justice (1614), and the heavy Grecian cathedral (1742–1802). Besides the fine promenade of the Place du Château, there are, outside the city, two extensive public gardens, known as the Jardin du Luxembourg and the Champ-de-Mars. Shipbuilding is actively carried on, especially in connection with the Newfoundland fishing trade; and besides this branch of industry, and the manufacture of briquettes and cotton yarn, Rochelle has glass-works, sugar-refineries, and brandy distilleries. The pop. (1872) was 23,924. Rochelle, which was known till the 12th century under its Latin name of Repella, ‘Little Rock,’ of which its present name is a mere transliteration, originated in a colony of serfs of Lower Picardy and from the persecution of their lord, settled on the rocky promontory between the ocean and the neighbouring marshes. On the marriage of Eleanor of Aquitaine with Henry II. of England, Rochelle, as part of her dowry, came into the possession of the English kings, by whom it was fortified in 1194, when it was taken by Louis VIII.; and, although it was ceded to England at the treaty of Bretigny in 1360, in the subsequent wars it was retaken by France, under whose sway it has remained since 1372. A stronghold of the Huguenots (q.v.), it was unsuccessfully besieged by an English fleet in 1627–28. In April of that year, several months again offered a heroine though unavailing resistance, under its mayor Guiot, to Cardinal Richelieu. Buckingham’s expedition to relieve it failed, and at last the defenders, reduced from 27,000 to 5000, had to surrender to the troops of Louis XIII. With the exceptions of three towers (1384–1476) its old fortifications were destroyed, and new lines of defences subsequently erected by the great Vauban. Réaumur, Bonpland, Billaud-Varenne, Fromentin, Bouguereau, and Admiral Duplex (1755–1846) were natives of Rochelle. The last a statue was erected in 1869. See Barbot’s Histoire de la Rochelle (ed. by Denys d’Aussy, 1886–91).

Rochelle Salt is the popular name of the tartrate of soda and potash (KNa₂CO₃.H₂O₄.4H₂O), this salt having been discovered in 1672 by a Rochelle apothecary named Seignette. It occurs, when pure, in colourless transparent prisms, generally eight-sided, and in taste it resembles common salt. It is prepared by neutralising cream of tartar (bitartrate of potash) with carbonate of soda. After a neutral solution has been obtained, it is boiled and filtered, and the resulting fluid is concentrated till a pellicle forms on the surface, when it is set aside to crystallise. This salt is a mild and efficient laxative, and is less disagreeable to the taste than most of the saline purgatives. From half an ounce to an ounce, dissolved in eight or ten parts of water, forms an average dose. A draught of Rochelle Salt added to one of the ingredients of an effervescing powder (bicarbonate of soda or tartaric acid, for example) forms one of the varieties of what are called Scillit powders.

Roches montonnées, smooth, rounded, hummocky bosses and undulating surfaces of rock, of common occurrence in regions which have been overflowed by glacier-ice. Those which have not been much acted upon by the weather generally show the erratics and groovings which are the characteristic markings of glacial action. Sometimes roches montonnées are smoothed and polished all over, and have the appearance of whales’ or dolphins’ backs. At other times they are smoothed on one side—that side, namely, which faces the direction from which the glaciating agent flowed; the other side, protected from abrasion, being left in its original rough, unpolished condition. The name roches montonnées is that used by the Swiss peasants—the bare rounded rocks of a valley-bottom when seen from above having a fanciful resemblance to a flock of sheep lying down.

Rochester, a city of Kent, 29 miles ESE. of London, lies chiefly on the right bank of the tidal Medway, continuous with Chatham, and joined to Strood by an iron swing bridge, constructed in 1830–50 at a cost of £170,000. The castle or keep, which crowns a steep eminence near the bridge, was the work of Archbishop William de Corbeul (1296); but the wall overlooking the river contains Norman masonry of earlier date, built upon Roman foundations. It is 104 feet high and 70 feet square, with walls 12 feet thick, and is a very fine specimen of Norman architecture; it was erected by John (1215, the south-east corner being rebuilt shortly afterwards), vainly attacked by De Montfort (1264), and taken again by Tyler (1381). Both castle and grounds were purchased in 1883 by the corporation from the Earl of Jersey. The episcopal see was founded in 604 by St Augustine, and the foundations of the cathedral then built have lately been discovered. Bishop Gundulf (1077–1107) built a new cathedral, of which part of the crypt remains. This cathedral was rebuilt by Ernulf and his successor the Count of Caen (1115–57), whose name remains; and the choir was enlarged in the 13th century in part out of offerings of pilgrims at the shrine of St William of Perth, a Scotch baker, who, on a pilgrimage to the Holy Land, was murdered near Chatham by his companion and adopted son; the tower rebuilt by Cottingham (1225–26), the choir and transepts restored by Scott (1871–77), and the west front being restored by Pearson in 1891. It measures 306 feet in length, and has double transepts; and special features of interest are the Norman west doorway and nave, the fine English choir which were naves, and early character, the spacious crypt, and a fine Decorated doorway leading to the modern library. The ruins of an early Norman keep or residence (?) built by Gundulf, the architect of the Tower of London, stand on the north side of the choir. Of Rochester’s bishops since 604, some eighty in number, may be mentioned Paulinus (previously first bishop of York), Gundulf, Walter de Merton, Fisher, Ridley, Atterbury, and Horsey. St Bartholomew’s Hospital, founded by Gundulf in 1075 for lepers, has been destroyed; while the Norman chapel remains. Watts’ Charity House, founded in 1579 to lodge ‘six poor travellers, not being rogues or proctors,’ has been immortalised by Dickens, whose home, Gadshill (q.v.), is 3 miles distant, and who introduces Rochester into Pickwick, Edwin Drood, and others of his novels. Three schools are the cathedral grammar-school (Henry VIII.), Williamson’s mathematical school (1701; reopened under a new scheme, 1880), and a grammar-school for girls (1888); and other buildings are Satchville House, Restoration House (Charles II. slept here in 1660), the guild-hall (1687), and the corn exchange (1871). Rochester— the Roman station Durobrivae and Anglo-Saxon Hræfes-ceaster —was made a municipal borough by Henry II. It lost one of its two members in 1885. James II. disembarked here on his Flight to France (1688). Pop. (1851) 16,508; (1871) 18,352; (1891) 20,170.

See Wharton’s Anglia Sacra (1691); Thorpe’s Register Roffense (1769) and Custumals Roffense (1781); and other works by Rawlinson (1717), Fisher (1772), Rye (1821), Watts (1786), Atterbury (Dickens and Rochester, 1889), and Pearman (1898).

Rochester, (1) capital of Monroe county, New York, is on both sides of the Genesee River, 7 miles above its entrance into Lake Ontario, and rail the Erie and Genesee Valley canals, by rail 67 miles ENE. of Buffalo and 300 NW. of New York.
ROCHESTER

The river has here three perpendicular falls of 90, 26, and 83 feet, and affords immense water-power.

The city is well built, and laid out with almost unbroken regularity. Among the principal buildings are the city hall, of blue limestone, and the court-house; a state industrial school (formerly a house of refuge), with accommodation for 900 boys and 400 girls; numerous churches, including a Roman Catholic cathedral; the Free Academy, and the university (founded 1850, and under Baptist control), and a Baptist theological seminary (whose library of 21,000 vols. includes that of Neander). There are thirty graded public and many private schools, libraries, arsenals, hospitals, &c. But the most noteworthy structure in the city is the handsome stone aqueduct of seven arches (850 feet long) by which the Erie Canal crosses the river. The principal industries are flour-milling, which has always been extensively carried on here, and the manufacture of ready-made clothing and boots and shoes, rubber goods, furniture, carriages, agricultural implements and machinery, steam-engines, glass, cigars, tobacco, perfumery, &c.; and there are besides numerous foundries, iron-works, cotton-mills, wool-mills, machinery, and flour-milling establishments. In the neighbourhood there are great nurseries, and in the city large seed-packing establishments. Rochester is a port of entry, and has a considerable trade both by lake and rail. It was settled in 1810, incorporated in 1834, and in 1890 was, in order of population, the twenty-second city of the United States. Pop. (1840) 20,101; (1860) 48,294; (1890) 133,896; (1900) 162,435.—(2) Capital of Ogle county, Illinois, on the Zumbro River (crossed by three iron bridges), 947 miles by rail NW. of Chicago. It has flour-mills, foundries, and manufactory of furniture, farming implements, &c. Pop. (1900) 6343.—(3) A city of New Hampshire, 21 miles by rail NW. of Portsmouth, with good water-power, and manufactures of flannel, blankets, shoes, &c. Pop. 8486.—(4) A borough of Pennsylvania, at the junction of the Ohio and Beaver Rivers, 25 miles by rail NW. of Pittsburgh, with deposits of coal, oil, &c., and various manufactures. Pop. (1900) 4688.

ROCHESTER, JOHN WILMOT, EARL OF, the Wittiest reprobate at the court of Charles II., was born at Ditcheley in Oxfordshire, 10th April 1647, and educated at Burford and Wadham College, Oxford. He next travelled in France and Italy, and on his return repaired to court, where his handsome person and lively wit quickly made him a prominent figure. In 1665 he showed conspicuous courage serving under Sandwich against the Dutch, as well as the summer after under Sir Edward Spragge—facts which agree ill with the stories that he would sink away in street quarrels and evade duels which he had himself provoked. With a friend, Mr Windham, he had entered into a formal engagement that, 'if either of us were killed, the other would apprise the world of the notice of the future state, if there was any.' Windham was killed in an attack upon Bergen, but did not afterwards disturb the rest of his friend, who now plunged into a life of the grossest dec. licence, was for five years together continually drunk, and revolved himself to letters, writing personal satires, buccannahian and amatory songs, and too often obscene and licentious verses, many of which, however, were doubtless fathered on him after his day. In these wild excesses he hazed out his youth and his health, till at the age of one and thirty he had exhausted the fund of life. On his death-bed he was convinced of the necessity of repentance by the arguments of Bishop Burnet, who writes: 'I do verily believe he was so entirely changed, that if he had recovered he would have made good all his resolutions.' He died 26th July 1686. His last conversations are touchingly described by Burnet in Some passages of the Life and Death of John, Earl of Rochester (1680; in vol. iv. of Wordsworth's Ecclesiastical Biography), a book, says Dr Johnson, 'which the critic ought to read for its elegance, the philosopher for its arguments, and the satirist for its grace.'

Rochester's verses show more wit than poetry, but he possessed in rich measure the gift of satire. An excellent example of this is his memorable epistle on Charles I.:—

Here lies our sovereign lord the king,
Whose word no man relies on;
He never said a foolish thing,
Nor ever did a wise one.

Equally well known is the description—'a merry monarch, scandalous and poor,' the line rhyming with which it is characteristically impossible to quote. But Walpole's judgment of his work is thus expressed in Royal and Noble Authors: 'Lord Rochester's poems have much more obscurity than wit, more wit than poetry, more poetry than politeness.' Before his death he expressed a wish that his indecent verses should be suppressed, but that very year these, and much more, were published ostensibly at Antwerp, really at London. Among the best of his poems known to be genuine are an Imitation of Horace on Lucullus, Verses to Lord Mulgrave, a Satire to Mann, and Verses upon Nothing.

ROCHESTER, VISOUNT. See KE, and OVER-BURY.

ROCHE-sur-YON, capital of the French department of Vendée, on the Yon, 50 miles SSE. of Nantes by rail, has a prefecture, lyceum, library of 12,000 volumes, a museum, and a theatre. Napoleon selected it in 1805—then a mere village to be the departmental capital. From 1815 to 1848 it was called Bourrier, and from 1848 to 1870 Napoleon-Vendée. Pop. 8789.

ROCHET (Low Lat. rochetis; Old High Ger. roch, 'cont.'; Ger. rock), a fine linen or lawn vestment proper to bishops and abbots, and worn also by canons of certain privileged chapters, and some other dignitaries. It is of the form of a surplice, but with sleeves fastened at the wrist; these formerly fitted more tightly to the arm than do the 'balloon sleeves' still commonly worn by Anglican bishops. In the Latin Church its use is very ancient. Formerly it appears to have been worn by clerics serving mass and by priests baptising, because it left their arms free (Lyndwood, quoted by Du Cange); but those priests who are privileged to wear the rochet are now commanded to regard it as a choir vestment, and are strictly forbidden to use it in the administration of the sacraments. In the First Prayer-book of Edward VI. the rochet was ordered to be worn at all public ministrations, and beside—i.e. over it—a surplice or alb. It is prescribed in the present Book of Common Prayer as part of the episcopal habit. The old 18th-century Anglican fashion of fastening the sleeves of the rochet to the chimerre—leaving the rochet itself sleeveless—is almost gone out.

ROCK. Though popularly restricted to masses of indurated matter, this term is extended by geologists to all substances which make up the crust of the earth, whether they be loose and friable like sand and soil, or compact and indurated like limestone and granite. The rocks of the earth's
crust (aqueous, igneous, metamorphic, &c.) will be found described under numerous distinct headings in this work. See the classification given at Petrography, and the article GEOLOGY, with the list appended, including such articles as DENUDATION. See also BUILDING STONE, BLASTING, BONG.

Rockall (in old maps Rocal, Rococh, &c.), on a deeply covered sandbank in the Atlantic 50 miles long and 25 broad, in 57° 36' N. lat., 13° 42' W. long., 160 miles W. of St Kilda, 290 from the nearest point of the Scottish mainland, and 290 from the north of Ireland. It is an isolated conical gravel island, rising 70 feet above the sea, and about 100 yards in circumference. At a distance it looks like a ship in full sail, the upper part being white with the dung of seafowl, and the lower part dark stone. This curious peak is further from the mainland than any other rock or islet of like size in any part of the world. Martin, in his St Kilda (1698), mentions that a crew of Frenchmen and Spaniards, shipwrecked at Rockall in 1685, escaped in their pinasse to St Kilda. The first landing known was in 1810. Vesuvius is the only other volcanic rock in use, in the case of a fission for fish-ponds from Scotland and from Grimby. See the account of a scientific expedition thither in 1890 in an article by Mr Miller Christy in the Royal Scottish Geographical Magazine for 1898.

Rock-basins, a name given by Sir Andrew Ramsey to limestone hollows in rock which have been excavated by glacier-ice. See LAKE.

Rock-butter, an impure alum efflorescence of a butter-like consistency found oozing from some alum slates.

Rock-crystal. See QUARTZ.

Rocket. A cylindrical case of paper or metal partially filled with an inflammable composition (saltpetre 68 parts, sulphur 32 parts, charcoal, or mealed powder, 32 parts), so that a large conical hollow is left inside. The base is open or has vents in it, and the head closed. On being ignited this composition burning over the whole surface of the hollow portion at once causes a great rush of gas outside the base, thus driving the rocket forward with great and increasing velocity. Rockets are used for signalling and to carry a light line for life-saving purposes (see LIFE-SAVING APPARATUS). Early in the 13th century they began also to be used in war. Sir William Congreve in 1698 introduced throw rockets as large as 24 lb. in weight, with thick iron heads adapted to act like a shell. They were fired from a tube and steadied in their flight by means of long sticks. In the more modern Hale rocket a rotary motion is given by causing the gas to pass out of the vents in the base before and between two projecting shields, shaped somewhat like the blades of a screw-propeller, against which it presses. The cumbersome stick is therefore no longer used, and the rocket is fired from a low trough with tripod stand, or even from the ground, by raising a mass of gas sufficient to give the required range, which may be as much as 4000 yards. Though extremely portable as compared with other missile weapons of similar power, rockets are so uncertain in their flight that they are not much used, except for incendiary purposes and for the making of a smoke screen. Against cavalry they would be very useful if they could be depended on. The rocket troop of the Royal Horse Artillery did very good service in the Peninsular war, however, and ships' boats, which could not carry a gun firing a 24-pound shell, could carry rockets charged with the weight into a place under bombardment. See PYROTECHNY.

Rocket, a name given to a number of plants of the natural order Crucifera, and belonging to the genera Brassica, Sisymbrium, Erysimum, Barbarea, Hesperis, &c. Garden Rocket (Brassica Hyacinth, or Erucia sativa) is an annual plant, a native of Austria, with stem 2 feet high, upright and branching; the leaves smooth, succulent, cut and toothed. When in flower it has a strong, peculiar, and disagreeable smell; but when in fruit this smell is almost imperceptible, and the leaves are used as a salad, for which it is frequently sown on the continent of Europe, and was formerly cultivated also in Britain. The name Garden Rocket is given also to Hesperis matronalis, also called Dame's Rocket [Hesperis matronalis], a little biennial or biennial in its growth, but sown as an annual, for which reason, our flower-borders. The Yellow Rocket of our flower-borders is a double-flowered variety of Bar- barea vulgaris (see CRESS). The Wild Rocket (Sisymbriun officinale, or Erysimum officinale) is common in Britain, and is sometimes sown and used as a spring potherb.

Rockfish. See Wrasse.

Rockford, capital of Winnebago county, Illinois, is on both sides of the Rock River, 80 miles by rail WNW. of Chicago. It is a well-built town, with shady streets, and contains foundries, flour, paper, cotton, and woolen mills, and manufactures of some local interest, such as slabs, pumps, chucks, furniture, cutlery, and plaited wickerwork. See the account of a scientific expedition thither in 1890 in an article by Mr Miller Christy in the Royal Scottish Geographical Magazine for 1898.

Rock-hamilton, a town of Queensland, Australia, situated on the south bank of the Fitzroy, 35 miles from its mouth, and 420 NW. of Brisbane. The town has main streets, lined with trees, and many substantial buildings, including the government offices, hospital, and town-hall. It owes its beginning (1858) to the extensive gold-fields in the neighbourhood, the annual yield of which is valued at $1,000,000 to 2,500,000; copper and silver are also worked to some extent. The land around is well adapted for grazing. The industries include tanning, soap and boot making, and meat-preserving. The chief port for central Queensland, its trade in exports (one-third) and imports reaches an annual value of 21,500,000. A bridge across the Fitzroy, with five spans of 232 feet each, connects Rockhampton (pop. 7431) with its suburb North Rockhampton (pop. 1700).

Rockingham, Charles Watson WENTWORTH, MARQUIS OF, a statesman of importance beyond his abilities, was born in 1730, the only son of that William Wentworth who succeeded in 1746, and was created marquis the same year. He had his education at Eton, was created Earl of Malton in the Irish peerage in 1750, and succeeded his father as second Marquis of Rockingham in December of the same year. In 1751 he was nominated lord-lieutenant of the North and West Ridings of Yorkshire, and in 1760 made Knight of the Garter, but soon found himself in opposition to the policy of the young king George III, and his favourite minister, Dute, and was disgraced from the lord-lieutenany in 1762. He found himself leader of the combination of Whig opposition, after the Duke of Devonshire's death in 1764, and in July 1765 was called on to form his first ministry. He repealed the Stamp Act, and would have done more for property but for the division of the court, added to the defection of the Duke of Grafton and his own want of influence in parliament. Rockingham resigned in August 1766, and remained out of office sixteen years in opposition to Lord North and the ruinous policy that led America. He was created Duke March 1782, with Fox and Shelburne as his secretaries, but died 1st July of the same year. See the Memoirs by the Earl of Albemarle (2 vols. 1832).
Rocking-stones, or Logans, are large masses of rock so finely poised as to move backwards and forwards with the slightest impulse. They occur in nearly every country. Some of them appear to be natural, others artificial; the latter seem to have been formed by cutting away a mass of rock round the centre-point of its base. The former are chiefly granitic rocks, in which felspar is abundantly present; for, this mineral being readily decomposed, the rock becomes disintegrated to grit, sand, and dust, which are carried away by rains and wind, so that what was formerly a solid rock soon assumes the appearance of a group of irregularly-shaped pillars, separated into portions by horizontal and vertical fractures. As decay proceeds, the edges of the blocks forming the pillar are first attacked and disappear, and the pillar now becomes a pile of two or more spheroidal rocks, resting one upon the other. Should a mass of rock be so situated as to preserve its equilibrium in spite of the gradual diminution of its base or point of support, a rocking-stone or logan is the result. Although rocking-stones are most frequently of a granitic nature, they occur also among basalts and other crystalline igneous masses. For the principle regulating the stability of equilibrium of rocking-stones, see Stability. Various explanations have been given of the uses of these singular objects. They are supposed to have been used in very early times for purposes of divination, the number of vibrations determining the oracle; hence it came to be believed that sanctity was acquired by walking round them.

Some rocking-stones occur near to remains of ancient fortifications, which seems to bear out a statement in one of the poems of Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece rocking-stones occur as funeral monuments, and are generally found on conspicuous places near the sea. Rocking-stones are numerous in Yorkshire, Derbyshire, Cornwall, and Wales. The famous Logan Rock, near Land's End, in Cornwall, is computed to weigh over 70 tons. It was wantonly displaced in 1824 by Lieutenant Goldsmith, R.N., and his boat's crew of nine men. He had to replace it at a cost to himself of £2000; but whether it has since rocked as well as ever is a moot point. Near Warton Crag, Lancashire, are no less than seven of these stones; and in Scotland they occur in the length by 10 feet in breadth, and rising for about 10 feet out of the water, swings to and fro with the motion of the sea, which is about seven fathoms deep. All these, however, are as marbles compared with the rocking-stone of Tandil in the Argentine Republic, 250 miles S. of Buenos Ayres, for this weighs over 700 tons, yet is so nicely poised that it rocks in the wind, and may be made to crack a walnut. See Frank Vincent's Around and About South America (1890), from which our illustration is copied.

Rock Island, capital of a county of that name in Illinois, on the Mississippi, opposite Davenport, Iowa (the two are connected by a wrought-iron bridge which cost $1,300,000), 181 miles by rail WSW. of Chicago. The island from which the town is named belongs to the United States, and is used as a public park; on it the government has erected a great arsenal and armory. The channel to the east of the island has been dammed so as to furnish immense water-power, and the city has flour and saw mills, besides foundries, machine-shops, glass-works, &c. Pop. (1880) 11,659; (1900) 19,493.

Rockland, (1) capital of Knox county, Maine, on the west side of Penobscot Bay, 58 miles by rail ENE. of Portland. The Boston and Bangor steamer touches here. The city has granite quarries, and many lime-kilns; it ships a million casks of lime yearly, and the New York post-office and St Louis custom-house are among the structures built of its granite. Shipbuilding is carried on, and there are iron and brass foundries, &c. Pop. (1890) 8190.—(2) A town of Massachusetts, 12 miles by rail SSE. of Boston, has large manufactories of boots, shoes, and tacks. Pop. (1890) 5327.

Rockland Lake, near the Hudson, 30 miles N. of New York City, is 3 miles in circumference, and furnishes 200,000 tons of ice annually.

Rockling (Onas), a genus of fishes of the Cod family Gadidae, represented on the British coasts by several species distinguished among other things by the number (3-5) of barbels. The larger species reach a length of 17 inches; but none are of any value as food, their flesh acquiring an unpleasant smell a few hours after being taken out of the water.

Rock-oil. See Petroleum.

Rock-plants, in Gardening, a term applied to a very numerous group of plants, which by their habit of growth are adapted to adorn rockeries. The plants are generally of lowly habit, either tufted, creeping, or trailing. They may be shrubby or herbaceous perennials, and certain annuals of trailing habit are occasionally used for temporary effects. But the more restricted use of the term comprehends merely the numerous species of Alpine plants (p. v.) and such as resemble these in their habit and adaptability to the purpose in view—the clothing of rock-work with verdure and

Three-bearded Rockling or Sea Loach.
ROCKY MOUNTAINS 787

with flowers in initiation of the natural conditions in which the Alpine flora appears in Alpine regions and in high latitudes.

Rock River rises in the south-eastern portion of Wisconsin, and flows south into Illinois, then south-west, and empties itself into the Mississippi 3 miles below Rock Island. Its course of 375 miles, much broken by falls, is through a region noted for its beauty and fertility.

Rock-rose. See CISTUS.

Rock-salt. See SALT.

Rock-soap, a mineral consisting of silica, alumina, peroxide of iron, and water, the silica nearly one-half, the alumina and the water sometimes nearly each one-fourth of the whole. It is earthy, easily broken, black or nearly so, very soft, and easily cut with a knife; is greasy to the touch, and adheres strongly to the tongue. It is valued by painters for crayons. It is found in Poland, Thuringia, and Bohemia, and occurs in basaltic rocks in the Isle of Skye and Antrim, in the form of nodules of a greenish-gray or brown colour. It is only found massive.

Rock-temples. In many parts of Western Asia, as at Ellora, Elephantia, Karli, and Salsette Island, natural rocks have been cut into temples; as at Petra (see the illustration). Out of India well-known instances of the same kind occur at Petra (q.v.) in the Arabian Desert, at Abu-Simbel (q.v.) in Egypt, and in China and Siam. There are remarkable cave-temples in the United States, one in Missouri, between the Salt River and Otter Creek; another near Manchester in Ohio. The rock-dwellings of Colorado, &c., are described at CAYE. See James Ferguson, Rock-cut Temples of India (1864), with seventy-four photographs by Major Gill.

Rocky Mountain Goat (Aplocerus), a beautiful animal of the antelope family, which inhabits the heights of the Rocky Mountains between the forests and the snow-line, from the 44th to the 65th degree of latitude. It is about the size of a goat, but is handsomer and more thickset, and has stronger legs. It is completely covered with long, thick, white hair, which forms an erect mane along the back from the horns to the root of the tail. Though it is hunted by the trappers, its flesh is not valued as food. The above species and the Prong-horned antelope (Antilocapra) are the only antelopes which occur in the New World. For the Rocky Mountain Sheep, see ARGALI SHEEP.

Rocky Mountains, formerly a name somewhat loosely applied to all the mountains of North America between the Great Plains and the Pacific Ocean, but now a term used designating only the eastern ranges of the great Cordillera system. This vast mountain-system acquires its greatest breadth within the limits of the United States, where between the parallels 38° and 42° N. lat. it attains a width of more than 1000 miles. Toward the north and the south the plateaus of this high-land gradually diminish in breadth, but they are enclosed on the east and on the west by high mountain-chains. Those forming the western boundary are the Sierra Nevada and the Cascade Ranges (q.v.), and the eastern chains stretching with uninterrupted continuity from the southern borders of the continent to the Dominion of Canada and to the Arctic Ocean constitute the Rocky Mountains. Between these eastern and western boundaries the plateau region is greatly diversified by chains which, as a rule, trend in the same general direction as the border ranges.

The name 'Rocky Mountains' is peculiarly appropriate, as there probably exists nowhere else such an extensive region of naked rock almost entirely devoid of vegetation. The geological structure is complex, but the greater part of the rocks exposed are Mesozoic intermingled with Tertiary and Quaternary deposits. As this system is consequently of much more recent origin than the Appalachians, it is naturally higher, and it presents also a sharper and more rugged outline. Its remarkably barren aspect is due to other geological peculiarities and to climatic causes. In comparatively recent ages this whole region has been the scene of vast volcanic eruptions, and the lava overflows which have covered the stratified rocks in many places to a depth of thousands of feet have augmented the expulse of sterile surface. By resisting the erosion of the streams and of the atmosphere, these lava beds have also greatly aided in producing the precipitous and deeply furrowed watercourses by which this wonderful plateau region is separated. Rocks or mountain barrier at the western boundary of the highland robs the winds which sweep across the Pacific of much of their moisture, and the great aridity of this region thus prevents the growth of vegetation. The surface is consequently exposed to continued erosive action, which is specially effective at the greater elevations. The denudation is the more complete as the sand and smaller disintegrated fragments are swept away by the winds, and no opportunity is afforded for the accumulation of a soil. On account of this circumstance the surface of the extreme western portion of the surface is uneven, and the region displays a labyrinth of naked crags and peaks arising from plateaus crossed by towering cliffs or deep canyons, with here and there an isolated butte. The scenery of the wonderful mesa or plateau region which lies between the United States and western Mexico, the Rocky Mountains, and extends from southern Wyoming through western Colorado, eastern Utah, and south into New Mexico and Arizona, is unequalled by that of any other portion of the globe. The country is divided by faults, flexures, and deep canyons into numerous plateaus and the wonderful carving of the rocks and the brilliant colouring of the exposed strata almost surpass belief.

A high plateau region in Wyoming, over which geese the Grand River Railroad, marks a separation of the Rocky Mountains into a northern and a southern group, each of which has its characteristic features. The continental divide which extends north and south with the ranges of the Rocky Mountains culminates in this plateau, where are found the extreme head-water streams of the great river-systems of the United States—the Mississippi, the Columbia, and the Colorado. The ranges of the southern group have a general north and south trend, and are higher than those of the northern group. As there are several elevated valleys known as Parks enclosed between the parallel ranges, this group is sometimes known as the Park System. It extends southward from the Laramie Plains across central Colorado into New Mexico. Its greatest development is in Colorado, where there are nearly forty peaks each over 14,000 feet in height. The Medicine Bow Range and the Colorado or Front Range form the eastern edge of the Rocky Mountain System, and rise abruptly from the gentler slope of the Plains. In this range are the well-known landmarks, Long's Peak (14,271 feet) and Pike's Peak (14,341 feet), as well as the Peak (14,341 feet), its highest point, which is too far west to be visible from the Plains. This range forms the eastern wall of North, Middle, and South Peaks, and the Park Range constitutes their western boundary. To the west of the southern end of the Park Range lies the Sawatch Range,
with the famous Mount of the Holy Cross (14,176 feet) and Mount Harvard (14,375 feet). Farther south are the San Juan Mountains, which constitute the western boundary of San Luis Park. To the north and west of this range lies a high broken country merging into the mesa region of western Colorado and northern New Mexico. The highest point of this section is the culminating point of this section. The eastern border of San Luis Park is formed by the Sangre de Cristo Range, which is almost a continuation of the Sawatch. Its loftiest summit, Blanca Peak (14,463 feet), is the highest point of the Rocky Mountains. The Elk Mountains and the Sawatch Range are marked with sharp volcanic peaks, lie to the west of the Sawatch Range. In the Parks rise the head-waters of the North and the South Platte, the Arkansas, the Grand, and the Rio Grande. Beside these large parks there are among these ranges many smaller but beautiful valleys. West of the Park Range are the Uintah Mountains, composed of a broad fold of thick strata, of which the Upper Tertiary and Cretaceous layers have been eroded to the depth of more than 3 miles, exposing the underlying Carboniferous rocks. This range has an east and west trend, and connects the eastern and western ranges of the Rocky Mountain System. The most important of the western ranges are the Wallowa Mountains, which form a part of the eastern rim of the Great Basin (q.v.), and which serve as the connecting link between the northern and southern groups of this system. The greatest development of the northern group is in Wyoming. The Wind River Mountains are the highest of the ranges, with Fremont's Peak (13,790 feet) as the culminating point. To the west are the Tetons, Mount Hayden (13,681 feet), and Mount Owyhee, which separate the head-waters of the northern group are wilder and less accessible than those of the southern chains, but not so high. They also present scenery which is less varied; they are not so definitely marked by regular ranges, and there are but few prominent peaks except in the groups already mentioned and in the geyser region of the Yellowstone. In Idaho and Montana there are numerous enclosed mountain valleys, which are called 'Parks' or 'Prairies,' but they are not so high as the 'Parks' of Colorado. The Bitter Root Mountains form the divide between the head-waters of the Missouri and those of the Columbia, and also between the tributaries of Clarke's Fork and of the Snake River. The Lapwai and Cœur d'Alene ranges, which lie to the west and northwest, connect the Rocky Mountains with the Blue Mountains, and between these groups and the Cascade Range are the Great Plains of the Columbia River. Yellowstone Park (q.v.), in the northwestern part of Wyoming, is famous for its hot springs, geysers, mud volcanoes, and its wonderful scenery. The disposition of the mountains toward the east is peculiar, as they occur in more or less detached groups, and which are the Crazy Mountains, Judith Mountains, and the Big Horn Mountains. Still farther east are the Black Hills, completely detached from the main system, and noted for their mineral wealth. Beyond the Canadian line too little is known of the Rocky Mountain System to warrant a description. Mount Hooker and Mount Brown seem to be but little over 9000 feet high instead of 15,000 feet. The highland gradually descends towards the north, reaching an elevation of about 800 feet in the vicinity of the Arctic Ocean, and in the northern ranges form the divide between the head-waters of the Mackenzie and Yukon Rivers.

**Rococo**, or **Rocaille**, a name given to the very debased style of architecture and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. The ornament consists of panels with their moldings broken or curved at the angles, and filled with foliage, shell-work, musical instruments, marks, &c. This style prevailed in Germany and Belgium during the 18th century, and in France from the time of Henry IV. to the Revolution. The illustration shows an example from an altar in the church of St James, Antwerp.

**Rocroi**, a third-class fortress of France, department Ardennes, 24 miles N.W. of Sedan, and 2 from the Belgian frontier. It is situated in the forest of Ardennes. Pop. 1791. Here the Great Condé (q.v.) broke the reputation of invincibility long enjoyed by the Spanish infantry, May 19, 1643.

**Rod**, called also a **pate**, or **perch**, a measure of length, equivalent to 64 yards, or 161 feet. The square rod, called generally a **rood**, is employed in estimating masonry-work, and contains 10¼ × 10¼, or 272¼ square feet.

**Rödbertus, Johann Karl**, designated the founder of scientific socialism, was born the son of a professor at Greifswald on 12th August 1805, and studied law at Göttingen and Berlin. For a few years he held law appointments under the Prussian government, but in 1836 settled down on his country estate at Jagetzow in Pomerania, and turned his attention chiefly to economic studies. In 1848 he was elected a member of the Prussian National Assembly, and for a fortnight filled the post of minister of Worship and Education; in the following year he carried the adoption of the Frankfort constitution for the empire, but retired from public life when the Prussian electors were grouped in three separate classes. He died on 6th December 1875. Although a socialist, Rödbertus was not a demagogic agitator: he believed that the socialistic ideal would work itself out gradually according to the natural laws of change and progress. Indeed he fixed upon five centuries as the time it will take to educate the people, the democracy, up to the socialistic ideal. When that ideal is realised the state will be the owner of all the land and capital of a country, and will superintend the distribution of the total products of human labour amongst those who do the labour, apportioning to each a share corresponding to his work. (His fundamental economic principle was of course that labour is the true and only source of wealth.) In the meantime he would not interfere with the working of the established laws of capital and land, nor with the principles of monarchical government. On behalf of the workers he advocated that the government should fix a normal working-day.
RODENTIA

a normal day's work, and a maximum and minimum of wages. His views are laid down in Zur Kenntniss unserer staatswirtschaftlichen Zustande (1842), Soziale Briefe (1850–51 and 1854), Zur Erklärung der Kreditnot des Grossbesitzes (1868–69), Der Normalarbeitsag und other papers in Tübinger Zeitschrift (1875 et seq.), and others in Jahrbücher für Nationalökonomie.

HIs Briefe and Aufsätze were edited by R. Meyer (2 vols. 1892), and his Kleine Schriften by M. Wirch (Beit. 1890). See monographs by K. Adler (1894) and Dietzel (1886–88). See also Soc. Linn.

Rodentia (Lat. 'gnawers'), an order of Mammals more rich in species than any of the others, including among its familiar representatives squirrels, marmots, beavers, rats and mice, lemures, porcupines, guinea-pigs, hares and rabbits. Most are terrestrial, and many are herbivorous, but a few are arboreal or even semi-aquatic. All are vegetarian, and gnaw their food. They are represented in all parts of the world.

Among the anatomical characteristics of Rodentia may be noted the chisel-like edge of the incisor teeth, which wear away in front less rapidly than they do behind, where the enamel coating is thinner or absent; the reduction of the incisors to two above and two below, except in the hares and rabbits, in which there are four above; the fact that the incisors and sometimes the back teeth also are rootless, and continue growing from persistent pulps; the absence of canine teeth, and the presence of a large space between incisors and premolars; the condyle in which the lower jaw works is elongated from before backwards—an adaptation to the peculiar motion of the lower jaw characteristic of rodent gnawing; the cerebral hemispheres are smooth, and leave the cerebellum uncovered; the intestine, as in many herbivorous animals, has a large cecum; the uterus is two- horned, the placenta discoidal and deciduate; the reproduction is in many cases very prolific.

Classification. — Sub-order Simplidíntata—with only one pair of upper incisors, having enamel only in front. This sub-order includes squirrels (Sciurus), flying squirrels (Pteromys), and marmots (Arctonyx), beavers (Castor), dormice (Myoxidae), rats and mice, voles, lemmings, musk-rats (Muridae), pocket-rats (Geomyidae), the capybara (Hydrochoerus), porcupines (Hystricidae), agoutis (Dasyprocta), guinea-pigs (Cavia). Sub-order Duplicitíntata—with two pairs of incisors in the upper jaw, the second pair behind the first, the enamel extending round the teeth, but thinner posteriorly. This sub-order includes only the Pleas or tailless hares (Lagomyys) and the hares and rabbits (Lepus).

See Waterhouse, Natural History of the Mammalia, vol. ii. 'Rodentia' (1848); Flower and Lydekker, Mammals, Living and Extinct (Lond. 1891).

Roderie, 'the last of the Goths,' whose tragic death, coincident with the downfall of the Visigothic monarchy in Spain, has inspired poets and romancers (Scott, Southey, Geibel, Dahn) to throw round him a halo of glory. Next to nothing authentic is known about him; but according to the commonly accepted legend, he was the son of a noble who was blinded by King Witiza. A crisis occurred having brought him into the hated Witiza by the elegance and the nobles of Roman blood, Roderic was elevated to the throne (710). The sons of Witiza, however, bided their time, meanwhile submitting to the usurper. At length certain unavailing plots were engaged in a plot to dethrone Roderic by Count Chandoa, the governor of Cata (in North Africa), whose daughter had been outraged by the Visigothic king. Julian brought over with him a Moorish chief named Tarik at the head of 12,000 men. Roderie met the invading army on the banks of the Guadalete, near Xeres de la Frontera, on 26th July 711. The battle raged six days; but the sons of Witiza, who commanded the wings of the Christian army, deserted during the contest, and the rout of the Visigoths was complete. Roderic either died on the field or was drowned in the Guadalete. On 27th July he attempted to swim his horse across. A third version, however, relates that he escaped and passed the rest of his life as a pious hermit. By this victory the Arabs became masters of southern Spain.

Rodez, a town of southern France (dept. Aveyron), stands on a bold bluff overlooking the Aveyron, 148 miles by rail NW. of Montpellier. The Gothic cathedral (1277–1535) has a tower, 260 feet high, crowned by a colossal image of the Virgin. There are several medieval houses, remains of a Roman amphitheatre, and a restored Roman aqueduct. Cloth-making, tanning, and cattle-dealing are the principal occupations. Pop. (1872) 12,111; (1886) 14,560; (1891) 12,065.

Rodgers, John, American naval officer, was born in Maryland, 11th July 1771, the son of a Scotch colonel of militia. He was a captain in the merchant service by 1789, and in 1798 entered the navy. In 1805 he escorted from Tripoli and from Tunis treaties abolishing blackmail and forbidding the slavery of Christian captives. On 23rd June 1812 he fired with his own hand the first shot in the war with Britain, and during the war he took twenty-three prizes. He died 1st August 1838. — His son, John Rodgers (1812–92), in the navy, captured a Confederate ironclad, and rose to be rear-admiral (1869), and superintendent of the United States naval observatory (1877).

Rodin, Auguste, the foremost of contemporary French sculptors, was born at Paris in 1840, studied under Barye, and began to exhibit in the Salon in 1872. He has produced great sculptural and symbolical groups, but is best known by his portrait busts and statues, notably the bust and the monument of Victor Hugo. See Monmouth in the Portfolio (1887); and Brownell, French Art (1894).

Rodman, Thomas Jeffverson (1815–71), an American soldier, was a designer of a rapid-firing casting cannon. See article CANNON, Vol. II. p. 714.

Rodney, George Brydges Rodney, Lord, English admiral, born 19th February 1719, was the second son of Henry Rodney, a cadet of an ancient Somersetshire family, the Rodney, who had merged in that of Brydges, and was at this time represented by the first Duke of Chandos. Henry Rodney served for a few years as cornet of horse in the wars of William III. and Anne, and afterwards, settling at Walton-on-Thames, obtained an appointment (1743) to the second rate of one of the royal yachts. In this capacity he was noticed by the king, who offered to stand as godfather to his second son. The Duke of Chandos was the other godfather, and after the two the boy
was christened George Brydges. He received his early education at Harrow, which he quitted at the age of twelve to enter the navy as a 'king's letter boy.' After serving chiefly on the Newfoundland station under a lieutenant in 1730, he joined the 7th ship in Mediterranean; in 1742 he was promoted by Admiral Mathews to be post-captain, and was sent home in command of the Plymouth, a 64-gun ship. He afterwards successively commanded the Sheerness, Ludlow Castle, and Centurion, and in 1747 the Surprise, in which he had a brilliant share in Hawke's victory over L'Estéandre on 14th October.

In 1748 Rodney went out in the Rainbow as governor of Newfoundland and commander-in-chief on that station, where he remained till 1752; in 1749 he joined the French convoy, and from 1754 to 1755 the Prince George. He was then appointed to the Dublin, one of the fleet under Sir Edward Hawke in the futile expedition against Rochefort, and in 1758 under Boscawen at the capture of Louisburg. In May 1759 Rodney was promoted to be rear-admiral, and in July commanded the small squadron which bombardaded Havre and destroyed the flotilla of flat-bottomed boats collected for the proposed invasion of England. In October 1761 he was appointed commander-in-chief on the Leeward Islands station, where in the early part of 1762, in co-operation with the land forces, he captured Martinique, St. Domingo, and Grenada. In October he was promoted to be vice-admiral, and returning to England in August 1763 was created a baronet, 21st January 1764. In November 1765 he was appointed governor of Greenwich Hospital, but in 1771, when it was resolved to active service, was promoted to be lieutenant governor, rear-admiral of Great Britain, and sent out as commander-in-chief at Jamaica. He hoped that he might succeed to the office of governor, which became vacant in 1773; but in his command he had shown an independence which was distasteful to Lord Sandwich, and his application was unsuccessful. In 1774 he returned to England, and for the next five years was left on half-pay, in very embarrassing circumstances, which compelled him to retire to France. It was not till October 1779 that he was appointed commander-in-chief at the Leeward Islands, and on 29th December he put to sea with, in addition to the West Indian ships, a powerful squadron and a large convoy of store-ships for the relief of Gibraltar, then besieged by the Spaniards. On 9th January 1780, when brought up abreast of Cadiz, he engaged in a battle with Spanish store-ships under the escort of a 64-gun ship, all of which he captured. Passing Cape St Vincent on the 16th he met the Spanish squadron under Don Juan de Langara, which he attacked with a dash and vigour that carried everything before him. Seven ships out of eleven were taken or destroyed; the others managed to escape into Cadiz. Gibraltar was thus relieved without further difficulty than was caused by the weather; and on 13th February Rodney sailed for the West Indies. He had scarcely reached St Lucia, which he made his headquarters, when he heard intelligence that the French fleet under the Comte de Graslin had put to sea from Martinique. He immediately followed, and, overtaking it on the 17th April fought an action in which, in despite of the fighting instructions, he attempted to concentrate his force on the enemy's rear. His signals were not sufficiently clear, the flag-officers and captains did not understand what was proposed, and the clever attempt resulted in comparative failure. During the following May he again twice met De Graslin, but without being able to bring him to a decisive engagement. In November he was nominated a K.B.; and in January 1781, in obedience to special orders from home, he seized on St Eustatius and the other Dutch settlements; but his health having broken down he was compelled to return to England a few months later. In December 1781 he again sailed for the West Indies; and as before, on arriving at St Lucia he had intelligence of the French fleet, under Comte de Graslin, having sailed, with some 3000 troops on board, for Cape Francois, where it was to join a strong Spanish fleet for an attack on Jamaica. Abreast of Dominica Rodney came: he has an excellent share in the action. In the morning of the 9th April, had the good fortune, on the 12th April 1782, to bring it to close action; and being enabled, by the varying nature of the wind, to pass through the enemy's line, he gained a brilliant victory, rendered still more crushing by the success of a small squadron detached to look out for stragglers in the Mona Passage. The French loss in killed and wounded was extremely severe, and seven of their ships were captured, one of them being the Ville de Paris, with the Comte de Graslin himself on board. The victory placed the English on a very different footing in the negotiations which had been already commenced; and the terms finally agreed on were much more favourable than might otherwise have been expected. But before the news reached England Admiral Pigot had been made Lord Pigot, and as a preliminary to supersede Rodney, who was looked on as a partizan of Lord Sandwich; and though an express was sent to stop Pigot on the way it failed to overtake him. Rodney returned to England, where—though raised to the peerage as Baron Rodney, with a pension of £9000 a year, and as a vote of thanks from the government. He had no further employment, and was allowed to live in comparative obscurity, which his shattered health perhaps rendered necessary. He died in London on 24th May 1792.

See his Life by General G. B. Mundy (2 vols. 1809), and Hanway's Rodney (*Man of Action* series 1801).

Rodostos or Rodigues, a hilly volcanic island (1700 feet), 18 miles long by seven broad, lies 380 miles off the coast of N. of Mauritius, of which it forms a dependency, being one of the Madeiran group. The soil is fertile, and agriculture is the chief occupation. The exports (agricultural produce and fruits) are valued at £6500 annually, the imports at £2100. Hurricanes often cause great damage to the island, which is encircled by a coral-reef. It was discovered by the Portuguese in 1645, and has been a British colony since 1814. The chief port is Port Mathurin. Owing to its isolation this island is particularly interesting to the botanist and the zoologist. Until near the close of the 17th century it was the home of the Sialaioi, or saigoa, an extinct bird. Pop. (1890) 1758. See Leguat's voyage thither (Hakluyt Society, 1803).

Roe (Capreolus capreolus), a small species of deer inhabiting Europe and some parts of western Asia, chiefly in hilly or mountainous regions which are covered with forests or with scattered hedges and heath, often not far from sea. In the higher parts it is found on seaweed-covered mountain tracts, the heath of the stag or red deer. It was once plentiful in Wales and in the hilly parts of England, as well as in the south of Scotland, but is now very rare south of Perthshire. The roe is about 2 feet 3 inches in height at the shoulder. Its weight is about 50 or 60 lb. Its colour is a shining grey-brown in summer, more dull and grizzled in winter; on the under
The carving-knives the has 1876), the inches that the 1831. the situated buck become 1884 the small the the Copenhagen. The See the also his having, often but its apt or the Nature's that chamois. fawns rm ii, furrowed ii, The deer, are somewhat long, peculiar and sea-son. The Ijorn Ijiger hut 65), liecame afterwards 1875), proved Barriers lie came 1849 to 1865, and again from 1874 till his death on 30th November 1879. The vigorous nature of his political warfare earned him the popular nickname of 'Toar em.' His greatest political triumph was the moving of a notion for inquiring into the condition of the army before Sebastopol in January 1855, which he carried by a large majority, causing the fall of the administration of the Earl of Aberdeen. He was appointed chairman of the committee which conducted the inquiry moved for. During the civil war in America he favored the Confederates. He supported Beaconsfield's policy during the Eastern crisis in 1877-78, and in 1879 was called to the Privy-council. He wrote The Church of England (1849), and History of the Whig Ministry of 1830 (1852). See his Life and Letters by Leader (1897).

Roentgen Rays. See RÖNTGEN.

Roermund, an old town in the Dutch province of Limburg, at the junction of the Roer and the Maas (Meesse), 29 miles by rail N. by E. of Maes- tricht. The cathedral (1218) is one of the finest Romanesque churches in the Netherlands. The church of St Christopher contains good paintings by Dutch masters. Principal industries are weaving woollen cloths and cottons and making paper. During the middle ages Roermund was on several occasions besieged and taken; its walls were demolished in 1819. Pop. (1890) 12,639.

Roeskilde, a city on the Danish island of Zealand, is situated at the southern end of the Roeskilde Fjord, about 20 miles by rail W. by S. of Copenhagen. In the middle ages this city, surrounded in 967 by the capital of the kingdom, and the seat of powerful bishops. The cathedral, built in the middle of the 13th century, contains the tombs of most of the kings of Denmark. Here peace was signed between Sweden and Denmark on 8th March 1653. Pop. (1890) 9794.

Roe-stone, a name locally given to those limestone which are formed of small globules like the roe of fishes. It has been translated into the scientific term Oolite (q.v.).

Rogation Days, the Monday, Tuesday, and Wednesday before Ascension-day, so called because on these days the Litany (q.v.) is appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasions of trouble danger or calamity is traceable very early in Christian use; but the fixing of the days before Ascension for the purpose is ascribed to Manerius, Bishop of Vienne, in the middle of the 6th century. In England the usage dates from perhaps the 7th century; after the Reformation the resitation of the Litany upon these days was discontinued; but a memorial of the old processions long survived in the so-called Perambulation of Parishes. See BOUNDS (BEATING OF THE).

Rogier I., count of Sicily, the youngest of the twelve sons of Tancred de Hauteville of Normandy, was born in that duchy in 1031. When twenty-
seven years of age he joined his famous brother Robert Guiscard (q.v.) in South Italy: but at first he seems to have fought against Robert more than he did his brother. At length the latter was reconciled, and Roger helped Robert to complete the conquest of Calabria. In 1060 Roger was invited to Sicily to fight against the Saracens: he took Messina, and settled a garrison there. Everywhere the Normans were welcomed by the Christians of Sicily as their deliverers from the Moslem yoke, and they won town after town, until in 1071 the Saracen capital, Palermo, was captured. Robert then invited Roger with the comptship of Sicily. Count Roger spent the rest of his life, apart from his numerous expeditions undertaken for the support of his brother, in completing the conquest of Sicily, which was finally effected in 1090. Already as early as 1060 Duke Robert had given his brother the half of Calabria, with the title of count. After Robert's death (1085) Roger succeeded to his Italian possessions, and became the head of the Norman power in Southern Europe. Pope Urban II granted him special ecclesiastical privileges, such as the power to appoint to the bishops, and made him papal legate of Sicily (1068). Roger died at Mileto, in Calabria, in June 1101. See Sicily.

Roger II, king of Sicily, the second son of Count Roger I, was born in 1067, and by the death of his elder brother Simon in 1075 became comte of Sicily. On the death of Duke William of Apulia, grandson of Robert Guiscard, his duchy passed to Roger, who thereupon proceeded to weld together a strong Norman kingdom in Sicily and South Italy: the Antipope Anacletus crowned him king of Sicily and Italy in 1097. He married his dominions the Norman principality of Capua (1136), the duchy of Naples, and the territories of the Abruzzi (1140). In the year prior to this last acquisition he managed to take prisoner Pope Innocent II., with whom he concluded an all advantageous bargain. Innocent recognised him as king of Sicily, whilst Roger acknowledged Innocent as pope, gave him his liberty, and held his kingdom as a fief of the holy see. The Byzantine emperor Manuel having insulted Roger's ambassador, Roger's ambassador, George Kallergis, was beheaded. Of Dalmatia and Epirus, took Corfu, and plundered Corinth and Athens (1146). He carried off silk-workers from the Peloponnesus to Sicily, and so introduced that industry into the kingdom. Roger then crossed the Mediterranean (1147) and won a large province from the Saracens, in North Africa—Tripolis, Tunis, and Algeria. His court was one of the most magnificent in Europe; he was tolerant to all the creeds of the various peoples under his rule; his government was firm and enlightened; his name a terror to both Greeks and Moslems. Roger died in February 1154, leaving his throne to his incapable son William. See Sicily.

Roger of Wendover (fl. 1236), Benedictine prior of St Albans, completed the work of Matthew Paris (q.v.).

Essay on Thomas Fuller (1856); Selections from the Correspondence of E. H. Gregson [a memoir of his life] (12 vols. 1859); and The Pilgrim's Progress: A Study of the Symbolism of the Bible, Congregationalist Lectures (1873).

Rogers, James Edwin Thorold, economist, was born at the village of West Moen, Hampshire, in 1823, and educated at King's College, London, and Magdalene Hall, Oxford, graduating with a first-class in 1846. At first an ardent Puseyite, he took orders, but soon returned to Oxford and became a successful 'coach,' and renounced his orders formally, together with Dr Congreve and Leslie Stephen, after the Clerical Disabilities Act of 1870. In 1862 he was elected professor of Political Economy, but made so many enemies by his outspoken zeal that he was chosen elected in 1868, nor until the death of Bonamy Price in 1888. An advanced Liberal in politics, he represented Southwark, 1880-83, and Bermondsey, 1885-86. He died October 12, 1890. His greatest work is his painful and lab6rrous History of Agriculture and Prices in England (6 vols. 1866-88), and its abridgment, Six Centuries of Work and Wages (1885). Besides these he wrote a study on Cobden (1873), edited the Speeches (1868) and Public Addresses of Bright (1870), the Wealth of Nations (2 vols. 1889), and the Collection of Proverbs (1624-1674).

Other books are Education in Oxford (1861); Historical Glances (2 series, 1869-70); The First Nine Years of the Bank of England (1857); The Economic Interpretation of History (1888); and, ed. by his son, The Industrial and Commercial History of England (1892).

Rogers, John, the first of the Marian martyrs, was born near Birmingham in 1565, graduated in 1587. He carried off his brother, a London rector (1592-34), and then lived for some years abroad, at Antwerp and Wittenberg, where he embraced the Reformed doctrines. He prepared a revised translation of the Bible (q.v., p. 127), which was published as 'Matthew's Bible' in 1557, and, returning to England in 1548, preached at St. Paul's Cross in 1553, just after Queen Mary's accession, against Romanism. After a long imprisonment he was tried as a heretic, and burned at Smithfield on 4th February 1555. See his Life by Colonel J. L. Chester (1861).

Rogers, Samuel, the poet, was born at the suburban village of Stoke-Newington on 30th July 1763, the second son in a family of nine, of a father, a City banker, and a mother, a Whig and dandy, a member of the congregation of Dr Price (q.v.); his mother, Mary Radford, was the great-granddaughter of Philip Henry. After a private education, at sixteen or seventeen he entered the bank, in 1784 was taken into partnership, and on his father's death in 1798 became head of the firm. His taste for literature and for the company of literary men awoke at an early period, and one day with a friend he had gone to call upon Dr Johnson at his house in Bolt Court, but his courage failed him when his hand was on the knock. In 1781 he contributed eight short essays to the Gentleman's Magazine; next year wrote a comic opera, containing a score of songs; and in 1786 (the year of Burns's first volume) published An Ode to Superbition, with some other Poems. In 1792 appeared The Pleasures of Memory; a Musical Entertainment, consisting of an Ode, and a dozen stanzas on Memory, which were turned into music by Thomas Arne. In 1795 he published The World of Appearance; in 1797 The Life and Death of Jephtha (1728-29). The last, in blank verse, proved a monetary failure; but the loss was recouped by the splendid edition of it and his earlier poems,

Other books were a Life of John Howe (1836); The Eclipse of Faith (1852), an admirable piece of argument, and its Defence (1854), in reply to P. W. Newman.
ROGEL

brought out at a cost of £1,500 (2 vols., 1830-34), with 114 illustrations by Turner and Stothard.

Meanwhile he had left the old home on Newington Green, and in 1803 (in which year, with £5000 a year, he withdrew from the bank as a sleeping partner) had given up the chambers in the Temple, and taken down the criminal cases in his house and his princely house, 22 St James’s Place, looking into the Green Park. He had had his affairs of the heart, had proposed, indeed, to a daughter of Banks the sculptor. She refused him, and left him free to cultivate his muse and cannie wit, to raise land, music, and in 1812 was abolished the life of litigation. She was taken by the Bank at home and on the Continent, and to gather an art-collection which sold at his death for £50,000. With Rogers one cannot help harping upon money, for he was rich as no poet perhaps before or after him. At least he made a good use of his riches, for he was quietly generous to Moore and Campbell, and others, unknown ones, whom it was no such credit to have aided. But with the kindest heart he had the unkindest tongue. ‘I have a very weak voice,’ he explained once to Sir Henry Tayler; ‘if I did not now put my foot on my own words I would have the whole country.’ With which, however, Campbell’s saying should be coupled: ‘Borrow five hundred pounds of Rogers, and he will never say a word against you till you want to repay him.’ Anyhow it has come to pass that ‘melodious Rogers,’ who ranked above Shakespeare and Coleridge, as we too might rank him if only his works had perished, is better remembered to-day by a few of those ill-natured things (e.g. by his witty composure upon Ward; see Epicure) than by his poetry, which, chaste though it be, and elegant and cultured, with ‘no such jailer as a vulgar line in it,’ is dead and mummified. It is no more a pleasure of memory, but unread, not even forgotten. One is reconciled somewhat to such oblivion by remembering how, when in his old age Fanny Kemble used to go and sit with Rogers, she never asked what she should read to him without his putting into her hands his own poems, which always lay by him on his table. For this was the Rogers who had announced his intention of being ‘read to, when old and beliridden, by young poets—or perhaps.’ There is not much more to tell of him—the bank-robbery (£47,000, 1844); the proffer by Prince Albert of the laureate

See Alexander Dyce’s Recollections of the Table-talk of Samuel Rogers (1856); Recollections by Rogers, edited by his nephew William Sharpe (1860); Hayward’s article in the Edinburgh Review for July 1829 (reprinted in his Essays, 1879); and, especially, P. W. Claden’s Early Life of Rogers (1887), and Rogers and his Contemporaries (2 vols. 1890).

ROGET, Peter Mark, was born in London in 1790, the only son of a Genevan who had settled as minister of a French church in London and married the daughter of Dr. Thomas Dyer, the most learned of the Edinburgh, became physician to the Manchester Infirmary in 1804, and in 1808 settled in London, where he became physician to the Northern Dispensary; F.R.S. (1815), and afterwards for nearly twenty years professor of physiology at the Royal Institution; and an original member of senate of the University of London, surviving till September 17, 1860. He wrote one of the 'Brotherhood Treatises,' On Animal and Vegetable Physiology considered with Reference to Agriculture (1824), The Elements of Physiology (1825), and The Elements of Anatomy (1826); and was the author of the famous Thesaurus of English Words and Phrases (1852), passed through 28 editions in his lifetime.

ROGHE-MONEY, an assessment formerly levied on every county in Scotland 'for defraying the charges of apprehending criminals, or subsisting them when apprehended, and of carrying on prosecution against them.' This tax was first imposed by statute, 11 Geo. I. cap. 26, on the narrative of bank-robbery, and the apprehension and escaping punishment for lack of the funds necessary to bring them to justice. The freeholders in each shire were directed to fix the assessment at any of the head courts yearly, and to appoint collectors. By 31 and 32 Vict. chap. 82 rogue-money in the shires was transferred to the local county councils. The Local Government (Scotland) Act, 52 and 53 Vict. chap. 50, sect. 11, this power of the Commissioners of Supply is now vested in the locally elected county councils. It is to be observed, however, that the repealed portions of 31 and 32 Vict. chap. 82 do not include sect. 10, which reserves the existing right of any burghe to levy rogue-money.

Rohan, an ancient Breton family of princely rank, descended in the male line from the dukes of Brittany, the House of Rohan count of Montferrat, which existed in the department of Morbihan. Its motto was characteristic of its pride: 'Roy ne pus, Duc ne daygne, Rohan says.' The family still flourishes in the line of Rohan-Guemene-Rochefort, naturalised with princely rank in Austria. The line of Rohan-Sombise became extinct in 1787, that of Rohan-Gié in 1638. The founder of the family was Alain I., fourth son of the Vicomte Eudon de Parné, who became Vicomte de Rohan in 1128. Under Charles IX. in 1570 the domain of Guemene was formed into a principality for Louis Rohan VI., whose son Louis became prince of Rohan-Guémené. The family was raised to the peerage in 1558 by Henry III. Due de Montbazan. Both the latter and his son Hercule (died 1654) bore arms against the League. The famous beauty, wit, and political intriguer, the Duchesse de Chevremuse (died 1670), was a daughter of Hercule. Louis, Prince de Rohan-Guémene (born 1633), lost the favour of Louis XIV. by his dissolute life, and died on the scaffold in 1674 for treasonable dealings with the Dutch.

Louis René Edouard, Prince de Rohan-Guémene, born 25th September 1735, embraced the clerical life in spite of dissolute morals and an extravagant love of luxury, and at an early age became coadjutor to his uncle the Bishop of Strasbourg. In 1772 he was sent as a special minister to Vienna. He spent three years there, and he ruined himself at the French court by slanderous gossip about Marie Antoinette. He was recalled in 1774, and, although with grudging, made grand-almoiner in 1777. Next year came a cardinal's last, through the influence of Stanislas Poniatowski, king of Poland; and a year later the succession to the bishopric of Strasbourg, held by three members of his family before him. His eagerness to recover his footing at court made him an easy victim to the schemes of Cagliostro and the adventurer Lamotte, and their clumsy forgeries and personages were powerful enough to make him pur- chase the famous Diamond Necklace for the queen. As soon as the plot was discovered the cardinal was sent to the Bastille, but was acquitted by the Parlement of Paris, 31st May 1786. He found himself in deep disgrace, but the king of France was elected to the States-general in 1789, but refused to take the new oath to the constitution in January 1791, and retired to Ettenheim in the German part of his diocese, where he died, 17th February 1803.

See DIAMOND NECKLACE, and books enumerated thereat; also a little narrative in Edma, par M. Louis de la Condamine, du Comte de Lamarre-Valeix (edited by Louis Lacour, 1858), and G. C. D'est Ango, Marie Antoinette et le
Rohilkhand, a division of the North-western Provinces of India, lying west of Oudh, has an area of 10,908 sq. m. and a pop. (1891) of 5,345,674.

Rohillas were Afghan Pathans who rose to power in Rohilkhand, India, about the middle of the 18th century. The Maharattas on one side and the Sikhs on the other pressed them hard; at last the Sikhs, with the help of British soldiers, put them down, and established the Ahom dynasty (1773-1791) in subduing them. See Sir John Strachey's "Hastings and the Rohilla War" (Oxford, 1892).

Rohlfis, Gerhard, German traveller in Africa, was born at Vegesack near Bremen on 14th April 1852, studied medicine at Heidelberg, Würzburg, and Göttingen, and joined (1855) the Foreign Legion service on an expedition to Algeria, and made himself thoroughly familiar with Mohammedan customs, he set off (1861) for Morocco, travelled through that country under the protection of the Grand Sherif, and was exploring the Wady Draa in the Sahara (1862) when he was attacked by his own guides, plundered, and left for dead in the desert. Two marabouts found him and carried him back to Algeria. In 1864 he again visited the Sahara, getting to Tuat and Ghadames; in 1865 he was in Fezzan and Tébésit; in 1866 in Bornu, whence he made for the Benue, and so reached the British expedition to Abyssinia in 1865; and was then sent to carry presents from the king of Prussia to the sultan of Bornu. In 1873-74 he was commissioned by the khalife of Egypt to lead an expedition to the oasis of Sirah (Jupiter Ammon) in the Libyan desert, as the basis of all original research in 1878 sent him to carry presents from the emperor to the sultan of Wadai; but the expedition was attacked and driven back by Arabs in the oasis of Kuira. The last public mission of Rohlfis was to take a letter from the German emperor to the king of Abyssinia, and early every one of his journeys is described in a separate book—e.g. Reise durch Marokko (4th ed. 1881); Reise durch Nord-Afrika in 1865-67 (1868 and 1873), in Petermanns Mitteilungen; Land und Volk in Afrika (1870); Queer durch Afrika (1874); and some other. He died at Gottingen 24 June 1896.

Rohrbach, a town of British India, in the Punjab, 42 miles NW. of Delhi. Turbins are manufactured. Pop. 15,699.—The district has an area of 1,797 sq. m. and a pop. (1891) of 590,475.

Rokitansky, Karl, Baron von, founder of the school of pathological anatomy at Vienna, was born at Königgrätz in Bohemia on 19th February 1804, studied medicine at Prague and Vienna, in 1828 was appointed assistant to the professor of Pathological Anatomy in the university of the latter city, and in 1834 succeeded him. He likewise held the offices of prosecutor at the city infirmary, legal executive to the city, and professor of the ministry of education and public worship. In 1869 he was made president of the Austrian Academy of Sciences. He retired from work in 1875, and died on 23d July 1875. Although Rokitansky agreed with the old humoral pathologists in thinking that he regarded the violence of the blood as the chief immediate cause of disease, he laid the principal stress of medical study upon morbid anatomy, post-mortem dissection, and observation. He stands pre-eminent amongst German medical teachers as the one who established pathological anatomy as a definite scientific inquiry in the domain of medicine. His teachings were published in the great work Handbuch der pathologischen Anatomie (5 vols. 1842-46; 3d ed. 1855-61; Eng. trans. of Sydenham Society, 4 vols. 1849-52), and in Memorials of the Vienna Academy of Sciences. See an anonymous Biography (Vienna, 1874).

Rokitno, a vast swampy region, now being gradually drained, between the rivers Priep, Dnieper, and Beresina in West Russia. This region is regarded by Pöseke as the original home of the Aryans, whence proceeded the lake-dwellers of Switzerland and the Po valley. See ARYAN RACE.

Roland (Ital. Orlando, Span. Rodom), the name of the most prominent hero in the Charlemagne legend. Unlike most legendary heroes,
Roland is a figure in history as well as in poetry and fable, though it cannot be said that the place he occupies as a historical personage is an imposing one. All that we know of him is contained in one line of Eginhard's Vita Karoli, chap. ix., and that simply records his name, Hron الماض, his rank of prefect or warden of the marches of Brittany, and his death on the hills of the Gascogne as a victim of the Pyrenean Sues. Such is the accoum from which a whole forest of romance has sprung up. According to the Annals (commonly attributed to Eginhard, but by some to Angilbert, who died fifteen years before they end), Charlemagne was at his death on the Pyrenees, and he spoke an embassy proposing an alliance and friendship, and that peace was concluded between them. At any rate it is certain that Charles made but a short stay in Spain, that on his way back he levelled the walls of acastle and made a present of it to his son, and that at a distance of 25 miles north-east of it the rearguard of his army was annihilated by the Gascogne. "Roscilla Vallis," the common etymology of Roussevalles, the scene of the disaster, is, of course, like all such etymologies, nonsense. In its oldest known form the name means "the naked height," but there can be no doubt that it is Basque. Whatever may be the true reading of the first syllable, the last two are clearly a corruption of zabal or zavet, a word which enters into the composition of perhaps a hundred place-names in Navarre and the Basque provinces, always indicating a flat, level space, which exactly describes the battlefield. It is a small oval plain, evidently an old lake-bed, shut in all round, except on the south where the waters escaped, by steep mountain-ridges clothed from base to summit with thick beech woods, and the noble forest where, by the Col of Ibiñeta, a path crosses the crest of the Pyrenees and descends the Val Carlos to St Jean-Pied-de-Port. The features of the spot, and the facts of the catastrophe, no doubt, also, are faithfully given in a few words by Eginhard, who in "the briefest manner that he could have written" he placed the scene of the battle, and then heard them spoken of by Charlemagne's old soldiers. As the army, by reason of the narrowness of the place, was marching in extended order, the Gascogne, who, profiting by the denseness of the woods that about there, had posted themselves in ambush on the heights, rushing upon those guarding the rear, hurled them into the valley beneath, and there slew them to a man; and having seized the baggage, dispersed under cover of the night in all directions, so that there was no finding them to take vengeance upon them, Roussevalles is in fact a natural trap and a trap that Charles as a general should have ventured into without first securing the heights and securing the woods; for when Roland, in the Chanson, thinks of it, it is too late. He was in a hostile country, made so by his own acts. It could not be otherwise. In the sight of his face — that he was compelled by military necessity to invade Navarre, that resistance forced him to take Pamplona, that levelling its walls, though it looked awkwardly like spite, was a precaution in view of a future campaign and that, in short, he 'sinned against the mercy of heaven' — But this, as Major Dalgetty observes, "excites no benevolence..."
would naturally from time to time introduce new ones for the sake of novelty or as connecting links, and thus a recognised sequence would be established, which, as minstrelsy became more and more of an art, the jongleurs more like troubadours, and their hearers more cultured and critical, would in course of time grow into a continuous lay. By some such process as this, in all probability, the Chanson de Roland, unquestionably the oldest and best of the chansons de geste, was produced.

The oldest form in which we have it is that of the MS. in the Bodleian Library, Oxford, written presumably towards the end of the 12th century; but the MS. is not a poem, though it is copied by the hand of a scribe and printed as a consecutive poem. M. Gautier, who loves precision, places his composition between the Norman Conquest and the first Crusade, but it is impossible to fix precisely the date at which it ceased to be a mere congeries of songs and became a chanson de geste; at any rate the two references to England as one of Charlemagne's many conquests cannot be relied upon. Nor do the allusions to Mont Saint-Michel justify the assertion that it is certainly the work of a Norman. It is of course in the language of the northern half of France, the language of a troubadour. No good reason for assigning it to any one province. An interesting reference to the country of the poem is spoiled by M. Gautier. The death of Roland, we are told, was prosaged in France by storms and earthquakes from Saint-Michel to Seinz, from Besançon to Wissant. It is not certain whether the place is Seinz or Saintonge. M. Francisco-Michel suggests Senlis; a 13th-century MS. reads Rainns (Reims); M. Gautier boldly proposes the 'saints of Cologne'—i.e., the relics preserved there. Far more probably, as a glance at the map will show, the place intended is Saintonge, the old capital of the Santones and of Saintonge, a town that makes a considerable figure in the middle ages and in the Charlemagne legend. With the other three places mentioned it forms a quadrangle which exactly represents the region within which the Lydie d’oil was dominant. Seinz of the line from Saintes to Besançon was the country of the langue d’oc, the Provencal; west of the line from Mont Saint-Michel to Saintes was the Breton; east of the line from Besançon to Wissant, near Calais, the language was Teutonic. This was not the case as long as it was regarded as synonymous with a North Rhine front, as M. Gautier imagines, but of the habitat of his hearers, the country where his words would be understood. The best, and most likely, the oldest part of the poem is that which deals with the combat at Roncesvalles, Roland's refusal, until too late, to sound his horn, the deeds and deaths of the peers one by one, and of Roland last of all. The opening portion, the despatch of Ganelon at Roland's suggestion as envoy to the Saracens, his anger and betrayal of Roland in revenge, and the concluding part, the vengeance of Charlemagne, and the trial and death of Ganelon, are of the same date. There can be little doubt that the episode of the Emil Baligrant was a comparatively late addition.

Besides the Oxford MS., there are half-a-dozen others ranging from the 13th to the 16th century. The differences between the earlier and later are far too slight to be the basis of the theory, so generally advanced, that one of the little pocket copies carried by the jongleurs, the assonant rhyme (that which disregards the consonants and depends on the accented vowel) is maintained throughout, the same assonance being kept up to the end of each break or paragraph. In this MS. the consonant rhyme, and the poem expanded to twice or thrice its former length. The first shape is the poem as sung; the second as adapted for readers when the minstrel was no longer the sole vehicle for poetry and reading was beginning a common accomplishment. A very close German version, the Rolandlied List, shows that early in the 12th century the chanson had passed out of its native country and language; and it is almost as closely followed in the Icelandic Kariolagniaga Saga of the 13th. The Chanson de Roland is the foundation of the Charlemagne legend, Charles's wars and quarrels with his vassals would no doubt have themselves furnished themes for the jongleurs, but the legend, culminating in the Morgante of Pulei and the Orlandes of Boiardo and Ariosto, is the outcome of the story of Roland and Roncevalles.

The following are the printed editions of the Chanson de Roland: From the Oxford MS., by Franciscus de Sanctis (Paris, 1837); Text, with translation, by F. Genin (Paris, 1859); the Oxford text, ed. by Professor Müller (Göttingen, 1861: reprinted with additions, 1863, 1878); 2d ed. of M. Beuninckx (Brussels, 1867); Text of 18th Nat. added (Paris, 1867): Renexoss, Oxford text, E. Boehmer (Halle, 1872); MS. of Lib. of St Mark, Venice, fac-simile by E. Kolding (Heibronn, 1877); Oxford MS., ed. by E. Stengel, with a photograph fac-simile (Heibronn, 1878); Text, with translation in assont rhyme, Petit de Jullienville (Paris, 1878); Text, with translation, commentary, notes, &c., by Léon Gautier (16th ed. 1887). There are a number of other translations of the poem, by J. Albin, and Juberdt. By far the best is the Baron d’Avril (Paris, 1855, 1866, 1877). The Rolandlied List was printed in 1727, and again by W. Grimm in 1858, and by J. Brecht (1841), and then by C. Hertz (1861). Mrs. Marsh in 1854 translated Vitet's epitome of the poem, and Mr John O'Hagan has given an accurate, scholarly, and spirited version from the original (2d ed. 1886). There is also an English translation by L. Rabillon (New York, 1885).

Roland de la Platière, Jean Marie, and his greater wife, Madame Roland (née Marie-Jeanne) are the most illustrious and memorable martyrs of the French Revolution. Roland was born of a decayed legal family at Villefranche near Lyons in 1754. He made his way unaided, and had risen to be inspector of manufacturers at Amiens, where in the close of 1775 he made the acquaintance of his gifted wife. She was twenty years his junior, having been born at Paris, 18th March 1754, daughter of an engraver, who had ruined himself by unlucky speculations. From the first an eager and imaginative child, she read everything, even heraldry, and Plutarch made her, for instance, to-day's Rolande, a republican for life. At eleven she went for a year into a convent to prepare for her first communion, next passed a year with her grandmother, and then returned to her father's house, where she read Buffon, Bossuet, and Helvétius, and at length found her gospel in the writings of Rousseau. Like admiring mother she lived in 1775, and the girl, solitary and poor, untouched in heart by her many admirers, and sourd to her father by his misconduct, at length in February 1780 married the estimable Roland. He was over forty, thin, yellowish, careless in dress, abrupt and austere in manner, to which a platoon as it came his way was at once dry, unsympathetic, and addicted to talking about himself. But she buried the latent passions of her heart, and for ten years under herself an admirable wife and mother, with perfect domestic simplicity. They lived at Amiens, where her only child, Jacob, was born, which was killed next to Lyons, and travelled in England and Switzerland. The Agricultural Society of Lyons charged Roland to draw up its cahier for the States General, and in February 1791 he went to Paris to watch the interests of his municipality, returned to Lyons in May, and was carried into the town in a coffin at the close of the year. It was now that Madame Roland's masculine intellect and woman's heart made her the queen of a coterie of young and eloquent enthusiasts that included all the famous and ill-fated leaders of the Girondine, Brissot, Buzot,
ROLAND

ROLLEF

Pétion, and at first even Robespierre and Danton. Her noble beauty, dark expressive eyes, sweet voice, and eloquent words added a charm to patriots that was renowned. In March 1792, Roland became minister of the Interior, and his still manners, round hat, and unbuttoned shoes struck dismay into the court. Three months later he was dismissed for his loyal remonstrance to the king, who had refused to sanction the decree for the death of the king's brother. Madame Roland's vigorous pen that wrote this letter, as indeed she wrote most of the papers that her husband signed. He was recalled after the king's removal to the Temple, made himself hateful to the Jacobins by his protests against the September massacres, and took his part in the last ineffectual struggle of the Girondists to form a moderate party.

It was in the last days of the Girondists that the reciprocal affection between Madame Roland and Buzot crossed the indefinite bounds that separate friendship from love. The two Maistre's three books still are, to one touch of softness that her nature needed, says Sainte-Beuve, to make it wholly feminine and French. But her Spartan soul sacrificed its passion to duty, and strong in the purity of her heart she made a confidant of her husband, partly perhaps because she felt an urge to sacrifice herself, but doubtless still more because the ideal love to that exalted virginial love was a love nourished upon sacrifices, that encircles its object with an aureole of respect, and dreads to find in possession the end of its enchantment. The struggle brought on six days of physical exhaustion, and in the seventh the sound of the tocsin announced the proscription of the Twenty-two (31st May). Roland had been arrested, but escaped and fled to Rouen; Buzot and some of the others fled to Caen to organise an insurrection, but in vain; the 4th July she herself was carried to the Abbaye. Sot at liberty two days later, she was arrested anew and taken to Sainte-Pélagie. She had five more months of prison before death closed her tragedy of life, and during this time she wrote her unfinished Mémoires, a study of her text, and on the 1st November, the execution of the Twenty-two, she was transferred to the Conciergerie for her own safety. She was taken to the Tribunal dressed in all white, her long black hair hanging down to the girdle, and in the dusk of the 8th November 1793 she was carried to the guillotine along with a trembling printer of assignats, whom she asked Sanson to take first to save her the horror of seeing her head fall.—‘You cannot,’ said she, ‘refuse the last request of a woman.’ It is usually told how, on the point of entering the awful shadows of eternity, she asked for pen and paper to write down the strange thoughts that were rising within her, but Sainte-

Beuve thinks it impossible, puerile, untrue to the nature of the heroine, as well as unauthenticated by good contemporary evidence. As she looked up at the statue of Liberty, she exclaimed, ‘O Liberté, comme on t’a jouée!’ or as it is still more commonly given, ‘O Liberté, que de crimes on commet en ton nom!’ She had often said her husband would not long survive her; a week later he ran himself through with his sword-stick near Rouen, November 15, 1793.

Madame Roland’s Mémoires reflects little of the horrors amid which it was written, but is a serene and delightful revelation of her youth in a series of charming glimpses. But in writing she is best and most natural in her letters, as in the series to Bose, those to Bérald des Issarts, the four to Buzot, and the exquisitely simple letters to her two school friends, Henriette and Sophie Cunet. The best editions of the Mémoires, for the first time printed in their entirety, are those of Dauban (1864) and Faugère (1864). Her Letters were collected by Dauban (2 vols. 1867). See the studies by Dauban (1894), Mathilde Blind (1860), and Idna M. Tarbell (1886); Launy, Deux Femmes Cultivées (1884); and Austin Dobson, Four Frenchwomen (1880); Sainte-Beuve, in Nouveaux Lumières, and in Portraits de Femmes; Schérer, in his Etudes.

Rolf, see Northmen, Normandy.

Rolle, Richard. See Hampole.

Roller (Coracias), a family of Picarian birds characteristic of the Ethiopian and Oriental regions, although the common Roller is extensively distributed in the Palaearctic region and a few species enter the Australian region. None are found in the New World. Malagascus possesses three species peculiar to itself, and so different from one another that they are regarded as types of different genera, and so different from other rollers that they are grouped into a separate sub-family, Brachypteracianae: they are named ground-rollers, and are nocturnal in habitat. An Indian species, Eurytoma orientalis, is also nocturnal. The Common Roller (Coracias garrula) is an autumn or more rarely a spring visitor to the British Isles; and about one hundred have been recorded since the first one was noticed by Sir Thomas Browne in 1644. Some have visited the Orkneys and Shetlands. One has been found as far west as St Kilda, and about half a dozen have been recorded from Ireland. It is a stranger to northern Europe; in central Europe it is common; in countries bordering on the Mediterranean it is very abundant. It ranges through Asia to Omsk in Siberia and to north-west India. In winter it extends its migrations to Natal and Cape Colony. In size it is about a foot long. The general colour is light bluish green; the mantle is chestnut-brown; the wings and rump are adorned with beautiful azure blue. The female resembles the male in plumage. Nesting takes place in the

The Common Roller (Coracias garrula).
woody haunts in May. The nest, which is made in a hollow tree or wall, is built of a few chips, or of roots, grass, feathers, and hair, according to circumstances. The eggs are five or six in number and are of a closey white colour. The food consists of insects and other small creatures on the ground.

The name 'Roller' is given to the bird on account of its varied and unsteady flight and the habit the male has, during the breeding season, of indulging in extraordinary tumbling antics, and turning somersaults in the air.

Rolleston, George, was born at Malthy in Yorkshire on July 29, 1829. He had his schooling at Gainsborough and Sheffield, next entered Pembroke College, Oxford, took a classical first-class in 1850, and was elected fellow of his college the next year. He studied at St Bartholomew's Hospital, and was appointed in 1855 a physician to the British Civil Hospital at Smyrna. Returning to England in 1857, he was made physician to the Radcliffe Infirmary at Oxford, and somewhat later Lee's reader in Anatomy. In 1860 he was appointed Linacre professor of Anatomy and Physiology, became F.R.S. in 1862, Fellow of Merton College in 1861, and was elected a fellow of the university of Oxford in 1864. In 1869 he was appointed condescendent to the principal of the College of Beauvais, but was ejected from this situation twelve years later owing to his Jansenistic sympathies. He was re-elected rector of the university in 1790, and died September 14, 1741. His Histoire des Études (4 vols. 1726-31) has been pronounced by Villeneau 'a monument of good sense and taste;' his Histoire Ancienne (13 vols. 1730-38), long popular and much translated, is feeble in its philosophy, jejune in its criticism, and often inaccurate; yet it has furnished the subject of ancient history to many men since the young prince Frederick the Great. His Histoire Romaine (16 vols. 1738-48) was a much inferior work, long since deservedly forgotten.

Rollein, Ludru. See LEdru-Rollin.

Rollo. See Northtwen, Normandy.

Rolls, Master of the, was formerly the chief of the twelve Masters in Chancery, entrusted with the care of grants passed under the great seal, and of all the records of the Chancery; he also sat on the equity side of the court as an independent though subordinate judge; doubts having been raised as to his jurisdiction, his powers were confirmed by act of parliament in 1570. The official residence of the Master of the Rolls was excluded from the House of Commons; he has since been transferred, by an act passed in 1881, to the Court of Appeal, but he continues to perform administrative duties as head of the Record Office. For the Rolls Series, see Records.

Roman Architecture. The Church (q.v.), and comprising the delegations of Bologna, Ravenna, Ferrara, and Forli. These delegations became in 1861 distinct provinces of the kingdom of Italy.

Romaic, a term for the popular Greek dialect developed before the fall of Athens. Romaic was essentially different from the modern Greek tongue as now spoken. The first who wrote in this popular tongue is believed to have been a monk Prodomus in the 12th century. Those who clung to the old Attic which still maintained an artificial existence called themselves Hellesos; the Romaic, which were called Romaicos, from Nea Romei ("new Rome"), the new name for the capital of the eastern empire. See Greece, Vol. V. p. 392.

Romaine, William, evangelical divine, was born at Hartlepool, Durham, September 25, 1714, and was educated at Hartford College and Christ Church, Oxford. He held curacies at Lew Trenchard, Devon, Burstead and Horton, Middlesex; was lecturer of St George's, Botolph Lane, and St Botolph's, Billingsgate, and of St Dunstan-in-the-West from 1744 till his death. He was also assistant morning preacher at St George's, Hanover Square, 1750-55; curator and morning preacher at St Olave's, Southwark, 1756-69; and morning preacher at St Bartholomew the Great, Smithfield, 1759. In 1764 he was chosen rector of St Andrew Wardrobe and St Ann's, Blackfriars, and though the election was disputed it was confirmed by the Court of Chancery in 1766, and he held the living till his death, July 26, 1786. Romaine was a bulk of Evangelicalism in his day, though himself infected with the taint of Hutchinsonianism. He assailed, not without credit, Warburton's Divine Legation of Moses; published commentaries, many sermons, and three books of edification that enjoyed for their simulations a remarkable popularity: The Life of Faith (1763), The Walk of Faith (1771), and The Triumph of Faith (1784). There is a complete edition of his works, with Life by the Hon. and Rev. W. B. Calogan (8 vols. 1796).

Roman Architecture. Of the early architecture of Rome and the other Latin cities comparatively little is known, but the early Roman architecture consist of a few arches and sepulchral monuments. With the conquest of Carthage, Greece, and Egypt the Romans became acquainted with the arts of those countries, and by degrees endeavoured to use them for the embellishment of the imperial city. Besides, Rome under the empire was the capital of the world, and attracted artists from every country. The result was that the architecture of Rome became a mixed style. It was largely imported, and partook of the character of the importers. The great interest of Roman architecture is that it is a mixture and amalgamation of ancient styles, and the starting-point for modern styles. It is thus the connecting-link between ancient and modern art; the whole history of Roman architecture being that of a transition, slow but steady, from the external architecture of the Greek temple to the internal architecture of the basilica. Rome borrowed from Greece the oblong peristyle temple, with its horizontal construction and decoration, and the various 'orders.' See COLUMN, GREEK ARCHITECTURE. From the Etruscans probably were derived the circular form of temple and the semicircular arch, with the other leading features in the development of the future Roman style. The peripteral form of the Greek temple, however, was seldom followed by the Romans, who preferred to adhere to the early Italian form of columns attached to the walls of the cela.

The Orders imported from Greece were the Doric,
Ionic, and Corinthian. These were all used in Rome, but with some modifications; the Doric, for example, being never employed as in Greece, being without fluting, and having the capital and entablature altered, and a base added, so as to make the style more similar to the others, with

which it was often associated. The Ionic had the volutes turned out angularwise, so as to present a similar face in each direction. The favourite 'order' of the Romans, however, was the Corinthian. It was invented in Greece, but more fully developed in Rome, where it suited the desire which existed for richness and luxuriance in architecture. Many fine examples of this style exist in Rome (as the Pantheon and the temple of Jupiter Stator) and in the provinces (as the Maison Carrée at Nîmes and the Great Temple at Baalbek), the capitals, wherever found, being designed in endless variety. The Composite order was an invention of the Romans, and is sometimes called the Roman order. It is a combination of the Ionic and Corinthian. All these orders were employed by the Romans, but in a manner peculiar to themselves; they combined with the Greek orders the arch. This feature, at first confined to substructures, was gradually introduced into the visible parts of the structure, and became finally an important element in the elevations. The columns were placed (fig. 1) at wide intervals, and set on pedestals to give them and the entablature a proper proportion; whilst behind the columns square piers were intro-duced, and from them arches were thrown which supported the wall. This was the favourite style of the Romans, and may be seen in all their important works (amphitheatres, arches, baths, &c.). They piled one order above another, marking each story with the entablature. As the style proceeded vaulting and arching became more common, especially in internal construction, but the horizontal ornamentation was never entirely abandoned. Arches of the above construction were thrown from pillar to pillar behind the entablature, but gradually the pier was omitted, and the arch openly constructed from column to column, the architrave bent round it, and the cornice continued horizontally above, as at Diocletian's palace at Spalato.

The buildings executed by the Romans are very varied in their character, but the same style was used for temples, baths, amphitheatres, triumphal arches, tombs, &c. The earliest temples of which remain exist are those of Jupiter Stator in the Forum, Jupiter Tomans, and Mars Ultor, all of the Augustan epoch, and each with only three columns left. These are supposed to have been nearly peripteral, and it is worthy of notice that the cells are all large, and one of them has an apse.

One of the most interesting temples of Rome is the Pantheon. The portico is of the age of Augustus, but the rotunda is probably considerably later. The dome of the interior is a splendid example of the progress of Roman architecture in developing the use of the arch, and transferring the decoration from the exterior to the interior. The former is in this case totally sacrificed to the latter; but the interior has not yet been surmounted for boldness of construction or simplicity and sublimity of effect (see Pantheon). Other examples of circular temples, on a small scale, are found at Tivoli and in Rome, both dedicated to Vesta.

The greatest works of the Romans, however, were not their temples. The Basilicas (q.v.), Amphitheatres (q.v.), and Baths (q.v.) are far more numerous and more stupendous as works of art, and all show how well the Romans had succeeded in producing an internal architecture, which at a later period became so useful as a model for Christian buildings. The Basilica of Trajan is a type of the Christian wooden-roofed churches; while that of Maxentius (fig. 3), with its great intersecting vaults, and its vaulted aisles and buttresses, contains the germs of the greatest Christian cathedrals. The Roman amphitheatres have never been surpassed for size and grandeur, or for suitability to their purpose. And of the baths sufficient remains still exist, although much decayed, from the perishable nature of the brick and stucco employed in their construction, to prove that the scarcely credible descriptions of contemporaries were surpassed by the grandeur of the buildings themselves. Other
VARIED public works are their many aqueducts and bridges, triumphal arches, pillars of victory, and tombs. See AQUEDUCT, and ARCH (TRIUMPHAL). Of the tombs of the Romans the earliest and best specimen is that of Cecilia Metella (wife of Crassus) on the Appian Way (fig. 4). It consists (like most Roman tombs) of a round drum placed on a square basement, and was probably surmounted by a conical roof. The tomb of Augustus was similar, on a very large scale, and the sloping roof was broken into terraces planted with trees. That of Adrian (now the castle of St. Angelo in Rome) is another enormous example. The tombs were generally ranged along the ways leading to the gates of cities.

The later tombs of Rome are well worthy of study, as they contain many specimens of the transition towards the Christian style. They are generally vaulted, frequently with domes, as, for instance, the tombs of St. Helena and Sts. Costanzo, Fergusson also places the so-called 'Temple of Minerva Medica' (fig. 5) amongst the tombs. It is a beautifully arranged building with ten sides, all containing deep niches (except the side with the door), surmounted by a clerestory, with ten well-proportioned windows. The vault is polygonal inside and outside; and the pendentives, ribs, buttresses, &c., which played so important a part in the Christian architecture both of the East and West, are distinctly used in its construction.

Of the domestic architecture of the Romans we have many wonderfully preserved specimens in Herculanenum and Pompeii, showing both the arrangements and decorations of the dwellings of all classes. Of the great palaces and villas, however, none remain except the palace of Diocletian, at Spalato, in Dalmatia; an imposing structure which shows many steps in the progress of the style.

See, besides the Handbooks of architecture, R. Adam, Ruins of the Palace of Diocletian (1764); Taylor and Cressy, Architectural Antiquities of Rome (1801); new ed. 1874); Freeman, Historical and Architectural Sketches (1876); T. G. Jackson, Dolus, the Quaerum, and Isitra (3 vols. 1887).

Roman Catholic Church. Cardinal Bellarmine, in his De Ecc. milit., chap. 2, defines the 'church militant' thus: 'An assembly of men united by the profession of the same Christian faith, and by the communion of the same sacraments, under the rule of legitimate pastors, and especially of the one year of Christ on earth, the Roman pontiff.' It is evident that this is really a definition of the Roman Catholic Church. The truth is that the Roman Catholic Church claims exclusive right to the title of Church of Christ on earth, and declares that 'outside of her fold there is no salvation.' This claim of the Church of Rome to be the exclusive means of salvation has been much misunderstood, and calls for some words of explanation. As we intend to remove a misconception, we explain first what the claim does not mean. It does not mean that none but Roman Catholics are in the way of salvation. This is sufficiently clear from the Encyclical letters ('Quanto conficioamur') of Pope Pius IX., dated August 10, 1863. 'It is well known,' writes His Holiness, 'that those who labour under an invincible ignorance concerning our most holy religion, and who at the same time sedulously observing the natural law and the precepts thereof, which are inscribed by God on the hearts of all, are ready to obey God, can, the virtue of divine light and grace working within them, attain to eternal life.' That is to say, then the Roman Catholic Church that none but Roman Catholics are saved. The sense of the axiom 'outside the Church of Rome there is no salvation,' as understood by Roman Catholic theologians, is that, whereas Christ came on earth to establish a church which was to be the divinely appointed means for the salvation of all men, the Roman Catholic Church is that church. Further light may be cast on the sense of this axiom by considering the distinction made by Roman Catholic theologians between the body of the church and the soul of the church. By the body of the church they understand the church considered as a visible and external society. By the soul of the church they understand the supernatural life of the members of the church—that is to say, sanctifying grace. Whoever, then, is in the state of grace belongs to the soul of the church. Whoever is not in the state of grace, even though he belong to the visible and external organisation or body of the church, does not belong to the soul of the church. Now the axiom 'outside the church there is no salvation' has reference primarily to the soul of the church. Thus, then, according to Roman Catholic doctrine, the man who is in the state of grace is saved. The Catholic who dies out of the state of grace is lost.

In the symbol commonly known as the Nicene Creed, faith is expressed in 'one, holy, Catholic, and Apostolic Church.' Christian antiquity then regarded unity, sanctity, catholicity, and apost-
liciety as properties of the true church. The Church of Rome claims to possess these properties, and to possess them manifestly, and in consequence claims to be the only true church of Christ. — The Church of Rome claims to be one, with the complete and most perfect unity, with unity of doctrine, unity of liturgy, and unity of government. (1) With unity of doctrine, the Church of Rome holds, and ever has held, that there are precisely the same faith: the learned, indeed, may have a larger acquaintance with the doctrines of faith than the illiterate; but there is nothing believed by the most learned theologian which is not believed, at least implicitly, by the most simple member of the faithful. The Roman Catholic Church says, 'I believe whatever the holy Catholic Church proposes for my belief.' (2) With unity of liturgy. In every part of the world the Roman Catholic Church offers the same unbloody sacrifice of the mass, everywhere administers the same sacraments, everywhere observes the same seasons and holy days, &c. (3) With unity of government. Roman Catholics, whether living under monarchical or republican governments, whether united to each other or divided from each other by their various nationalities, always acknowledge the same authority in their pastors and bishops, and above all to the Holy See. Indeed, it has perhaps never been denied that with respect to unity the Roman Catholic Church excels all other churches. — The Roman Catholic Church claims to possess visibly the same apostolic succession. She claims to be holy (1) by reason of the holy doctrines which she teaches. Thus, she insists upon the great truth of moral responsibility. She declares that, though man's freedom of will was impaired by the Fall, it was not destroyed, and that no adult can be saved without the due exercise of it. She proclaims that 'faith without works is dead.' She calls upon her children to confront their evil passions with the weapons of fasting and mortification in their hands; holds in high honour the life of voluntary poverty, chastity, and obedience; and declares that such was the life of the Lord and of the precursor of the Lord. (2) By reason of the means of holiness which she provides. Prominent amongst these a Roman Catholic would note that Christ himself has commanded this: 'Ye shall be my witnesses;' and he will also add that, while the Church of Rome accepts the Word of God alone and exclusively as the Rule of Faith, besides the Sacred Scriptures or written Word of God it admits an unwritten Word of God, which possesses an authority equal to that of the written Word. By this unwritten Word of God Roman Catholics understand a body of truths delivered by Christ to the apostles, and by the apostles to their successors, and which were not in the first instance committed to writing. It is certainly worthy of note that Christ himself did not command his apostles to write, but to preach; that only five out of the twelve apostles—reckoning St Mathias in the place of Judas—are recorded to have written anything at all; that three out of these five—St Peter, St James, and St Jude—have left us nothing more than brief epistles, written under particular circumstances, and for special reasons; that more than half of the New Testament was written by inspired men who were not among the apostles to whom the commission was addressed by our Saviour. The church is the depositary, guardian, and living and infallible interpreter of both the written and the unwritten Word of God. It may be remarked, in passing, that there would seem to be some analogy between the Roman Catholic rule of faith and the civil constitution of England. According to Judge Blackstone's Commentary, the municipal laws of England are divided into lex non scripta, the unwritten or common law, and the lex scripta, or statute law; and the common law is the 'first ground and chief corner-stone of the laws of England.' If the question arises as to how these customs or maxims are to be known, and by whom their validity is to be determined, Blackstone decides that the question must be settled by the judges in the several courts of justice, for these judges are 'the depositories of the law; the living oracles, who must decide in all cases of doubt.'
The Church of Rome teaches that no addition has ever been made to the deposit of faith which, by the apostles to the church, and that no objective increase of revelation is to be expected. She does not deny that divine revelations have been made to individuals since the days of the apostles, but she holds that such revelations do not increase the deposit of Christian revelation, and do not constitute an article of Catholic faith to be professed by all the faithful. The faithful are not bound to accept revelations made to private persons, even though the church should express approval of these revelations; for it is understood that it refuses nothing by force of law to guarantee their genuineness. The approval of the church amounts to no more than a declaration that there is nothing in the supposed revelations at variance with sound faith and morality. But though the entire deposit of faith was received by the church from the apostles, it does not follow that all the truths contained in this deposit were revealed explicitly, and have been at all times explicitly taught by the church. There has, indeed, never been any difference with respect to the formal object, as it is called, or motive of faith. The truth has always been accepted on the authority of God who revealed it. But with respect to the material object of faith—i.e. the truths of revelation—there has been this difference, that, while some have been from the first explicitly believed, others were at one time believed implicitly only. The distinct proposition and promulgation of these latter doctrines belongs to the magisterium, or teaching office, which the church exercises under the guidance of the Holy Spirit.

The church fulfills this teaching office in many ways: (1) By indicating in detail the various truths contained in some complex article of explicit faith. Thus, it was always expressly believed by the church that our Saviour was a true and perfect man. But if our Saviour was truly man it follows that he possessed a human body, a rational soul, a human will, and a human heart. From these and various consequences the church distinctly proposed for explicit belief, on the emergence of the Gnostic, Apollinarian, Monothelite, and other heresies at variance with these consequences. Or, to take an instance from Roman Catholic theology, the primacy of the Pope has always been a principle of faith explicitly believed. But, as occasion and circumstances required, the church has proposed for explicit faith one or other of the prerogatives involved in this primacy. (2) By enunciating in particular truths already comprehended in some universal proposition of explicit faith. Thus, while the church had already taught that grace was necessary for all salutary actions and states, on occasion of the Semipelagian heresy it distinctly decreed that grace was necessary for entrance into the way of salvation and for permanent possession of sin. This, and the like, distinctly and articulately what was already believed, though with less distinctness. Thus, according to Roman Catholics, it has always been the belief of the church that it was due to the honour of the Son of God that His mother should be free from sin; and that sin has never been imposed on sinners since the Incarnation; that in recent years of the doctrine of the Immaculate Conception was no more than the distinct and articulate declaration of a truth which had been an object of implicit belief from the first. (4) By expressly declaring some truths which had been, or were, believed only by the ecclesiastics of the church. Thus, the church, by not rebaptising those converted to her fold from heresy, had practically manifested her belief in the validity of baptism conferred by heretics; but when the validity of heretical baptism was impugned she expressly declared that such baptism, however administered, and with whatever form, and intention were employed such baptism was valid. Thus, then, according to the Roman Catholic teaching, there may be truths objectively contained in the deposit of revelation, or the remote rule of faith, which have not been always clearly propounded and promulgated by the particular rule of faith—i.e. the deposit—of the church. Until they are thus proposed and promulgated they may be subject to question without loss of faith; for the unity of faith is maintained so long as there is due submission to the successor of Peter. From this it is clear that many doctrines we may distinguish three distinct phases: (1) In the first instance, they are implicitly contained in revelation indeed, but not yet proposed by the church; and by the faithful they are not explicitly believed, neither are they called in question. (2) Then arises a controversy concerning these doctrines; some are for accepting, others for rejecting them. (3) Finally, the church, either by solemn judgment or by her common teaching, declares that these doctrines belong to the deposit of revelation; and thenceforward they are an object of faith as well as of orthodoxy.

For the teaching of the Roman Catholic Church concerning the Holy See we must refer our readers to the articles Pope, Infallibility, &c. We may, however, mention here that the very name Roman Catholic is intended as an expression of the belief that there can be no true Catholicity without union with Rome. Roman Catholics assert that there can be no catholicity without unity; and that they contend that the See of Rome has always been regarded as the source of unity, and that communion with Rome was regarded by the early church as the ultimate test of orthodoxy. In support of this contention they quote many striking declarations of the Fathers and of the early councils. The name 'Roman Catholic' is not new. Cardinal Newman, writing of the 5th and 6th centuries, says: 'It is more than the Roman patriarchs of old. And thus the college of cardinals was denoted by the additional title of "Romans." Nor was this association of Catholicism with the See of Rome an introduction of that age' (Essay on Development, chap. v.).

The hierarchy of the Roman Catholic Church consists of the Pope, the Bishop of Rome, who is assisted by the Sacred College of Cardinals, and by several sacred congregations, or permanent ecclesiastical committees; of the patriarchs, archbishops, and bishops; of the apostolic delegates, vicars, and prefects; and of certain abbots and prelates. The cardinals, who are the advisers and assistants of the sovereign pontiff, constitute the supreme council or senate of the church; and on the death of the pontiff they elect his successor. The College of Cardinals, who consist of 70 members: 6 cardinal bishops, whose dioceses are the 6 Suburban dioceses of Rome; 20 cardinal priests, who belong to various dioceses, 76 prelates of the States; and 1 Belgian. The sacred congregations, about 20 in number, consist of cardinals, consultors, and officials, and carry on the central administration of the Roman Catholic Church. The following are the principal congregations. (1) The Congregations of Propaganda, which administers the foreign missions, and execution of the decrees of the Council of Trent, and for receiving from bishops reports on the state of their dioceses. Attached to this there is a special Congregation for the Revision of Pro-
vincial Synods. (2) The Congregation of Bishops and Regulars, for judging appeals against episcopal sentences, for the hearing of causes between bishops and regulars, and for the revision and approbation of rules of religious bodies. (3) The Congregation of Propaganda of the Faith, in charge of the study and direction of the faith and the government of the church in non-Catholic countries. Attached to this there is a Congregation for Affairs of the Oriental Rite, with a commission for the revision and correction of Ceremony. (4) The Congregation of Sacred Rites, for the decision of all matters connected with the liturgy, rites, and ceremonies, and for the conduct of the processes of the beatification and canonisation of saints. (5) The Congregation of the Index, for the condemnation of writings prejudicial to faith or morality. (6) The Congrega-
tion of the Holy Office, sometimes known as the Congregation of the Inquisition, for the examination and repression of heretical doctrines. (7) The Congregation of Indulgences and Sacred Relics, for the proclamation of indulgences and the decision of questions relating to them, and for the authentica-
tion and distribution of relics. (8) The Congregation of Ecclesiastical Immunity, for maintaining ecclesiastical privileges and exemptions, as to persons, places, and things. The jurisdiction of the congregations does not cease on the death of the pope, but it is suspended during the process of election, and the business is suspended during the vacancy of the Holy See.

There are 10 patriarchates, with 14 patriarchal sees—8 of the Latin rite, and 6 of Oriental rite. The Latin patriarchates are those of Alexandria, Antioch, and Jerusalem. There are 14 patriarchal sees, Latin, Maronite, Melchite, and Syriac; Constantine, Latrun, Jerusalem, and the See of Constantinople. There are in the con-
munion of Rome, besides the 14 patriarchal sees, 830 archiepiscopal and episcopal residential sees of the Latin rite, and 51 archiepiscopal and episcopal residential sees of the Oriental rite. Besides the archbishops and bishops of these residential sees, there are in Rome 10 metropolitan archbishops and 123 bishops of titular sees. In the British empire there are 123 Roman Catholic residential archiepiscopal and episcopal sees, 23 vicariates-apostolic, and 8 prefectures-apostolic, with a Roman Catholic provincial see of India. Of the 23 vicariates-apostolic in the British empire are held or administered by bishops of titular sees. Titular sees, or, as they were styled till 1882, see in partibus infidelium—i.e. sees which in ancient times existed in those eastern regions which have now lost the faith and fallen into barbarism—are, for the most part, assigned to archbishops and bishops who are appointed to apostolic delegations, of which there are 9, or to vicariates-apostolic, of which there are 125, or to prefectures-apostolic, of which there are 59, or to the office of coadjutor, auxiliary, or coadjutor or vicar-apostolic and vicars-apostolic enjoy episcopal juris-
diction, and exercise episcopal powers, in countries where a hierarchy proper has never been established, or having once existed has been suppressed. With the con-luence of the Pangæan Council in 1870, the Church of England was at first placed under the jurisdiction of archpriests or prefects-apostolic. But in the year 1620 Pope Gregory XV. appointed a vicar-apostolic with juris-
diction over the diocese of London. After sixty years, in 1688, Pope Innocent XI. created four districts or vicariates, the London, Midland, Northern, and Western, appointing to each district its own vicar-apostolic. Gregory XVI. created eight districts or vicariates, the London, Western, Eastern, Central, Welsh, Lancashire, Yorkshire, and Northern, each district having, of course, its own vicar-apostolic. In 1850 Pope Pius IX. re-established the Roman Catholic hierarchy in England, and the nine prelates of the old English hierarchy became bishops of titular sees. Thus, Cardinal Wiseman, who before the restoration of the hier-
archy was vicar-apostolic for the London district, was entitled while vicar-apostolic Bishop of Meli-
potamia. Prefects-apostolic are as a rule not bishops, but they are frequently the principal representa-
tives of the Holy See authority to exercise quasi-episcopal juris-
diction in missionary countries.

As is well known, the Latin rite prevails with few exceptions in the West, and also in some regions of the East; nevertheless various other rites are also followed within the communion of Rome. These are (1) the Greek rite, of which there are the following forms. (a) The Greco-Romanian. There are 3 bishops and 1 archbishop of this rite, whose sees are situated in Austria-Hungary. The lan-
guage of the liturgy is Romanian, excepting the parish of Seausin, in the diocese of Lugos, where the language employed is the ancient Slav. (b) The Greco-Ruthenian. There are 8 bishops and 1 archbishop of this rite, with sees in Austria-
Hungary and Russia. The liturgical language is Illinian. (c) The Greco-Bulgarian. Of this rite there is an archbishop, vicar-apostolic, for Constantinople and its neigh-
brourhood, with 2 bishops, vicars-apostolic, for Macedonia and Thrace. The liturgical language is Illinian. (d) The Greco-Melchite rite is the Melchite patriarch of Antioch, with 4 archbishops and 9 bishops, whose sees are situated in Syria. The liturgical language is Arabic. There are missions in Cessarea in Cappadocia, Constantinople, and Malga in Thrace of the pure Greek rite, which are also in communion with Rome. (2) The Syriac rite, of which there are the following forms. (a) The pure Syriac. Of this rite is the Syriac patriarch of Antioch, with 4 arch-
bishops and 8 bishops, whose sees are situated in Egypt, Syria, and Turkish Armenia. The litur-
gical language is Illinian. (b) The Syro-Chaldaic. Of this rite is the patriarchate of Babylon, with 4 archiepiscopal and 7 episcopal sees situated in Kurdistan, Turkish Armenia, Mesopotamia, and Persia. The liturgical language is Illinian. There are also in the ancient Slav dialects such rite all over Europe, as for instance the Maronite rite of Antioch, and 7 archbishops and 2 bishops, whose sees are situated in Syria, in various other provinces of Asiatic Turkey, and in the island of Cyprus. The litur-
gical language is the ancient Syriac. (d) The Syro-Malabaric. This rite is followed in the vicariates-apostolic of Kottayam and Trichur in the East Indies. The liturgical language is the Syro-Malabaric. (3) The Armenian rite. To this rite belong the Armenian patriarchate of Cilicia, the archiepiscopal sees of Jerusalem and Antioch, the episcopal see of Artin in the Russian empire, and 17 episcopal sees situated in Turkish Asia, Egypt, and Persia. The language of the liturgy is the ancient Armeniam. (4) The Coptic rite. Of this rite there are two forms: (a) the Coptic liturgy is also observed in Egypt, where the Coptic or ancient Egyptian is the language of the liturgy; (b) the form observed in the vicariate-apostolic in Abyssinia, where the liturgical language is the ancient Ethiopic or Geez.

The Roman Catholic populations of the various countries of the world are, according to The States-
man's Year-book (1900), as follows: Great Britain and Ireland, 5,415,000; Austria-Hungary, 27,756,000; Belgium, 6,650,000; Denmark, 3,647; France (1881) 29,201,703; Germany, 17,675,000 (including
Greek Church); Greece, about 12,000; Italy, 31,757,000; the Netherlands, 1,596,000; Portugal, 5,049,000; European Russia, 8,300,000; Spain, 17,536,000; Sweden and Norway, 2,400; Switzerland, 84,000; European Turkey, estimated at 1,000,000; total Roman Catholic population in Europe, approximately 155,130,000, while Mulhall's Dictionary of Statistics (1895) states it at 162,310,000.

The latter quotes the American Statistical Society's figures of Roman Catholic population (1883) of the grand divisions, as follows: Europe, 160,380,000; Africa, 3,010,000; America, 2,660,000; Oceania, 657,000; grand total, about 225,000,000, as against the 240,000,000 estimated in Hazell's Annual for 1897.

See Cardinal Manning's Temporal Mission of the Holy Ghost; Newman's Essay on Development of Doctrine; Wiseman's Lectures on the Catholic Church; Ward's Essays on the Church's Doctrinal Authority; Murphy's Chair of Peter (1888); Leibnitz's System of Theology, translated by Russell (1890); Catholic Directory (Burns and Oates); Missions Catholiques (Propaganda Press, Rome). The organisation and statistics of the Catholic Church will be found in the relevant paragraphs on the several Catholic countries. The more important Catholic documents are all dealt with in separate articles in this work; as are also the saints and thinkers. See especially the articles:

Roman Catholic Emancipation. See Catholic Emancipation.

Romance Languages, a general name for those languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia. When the Roman empire was broken up by the invasions of the northern nations (in the 6th and 7th centuries) the invading tribes stood to the Hellenic invaders in the relation of a ruling caste to a subject population. The dominant Germans continued, where established, for several centuries to use their native tongue among themselves; but from the first they seemed to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and most of the language of the rulers was merged in that of their subjects; not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution therefor of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (lingua Romana rustica) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue—but chiefly by slightly pronounced, the neglect or misuse of grammatical forms, and the use of 'low' and unusual words and idioms. As distinguishing the Romance from the Latin, the absence of the functions of the church, the school, and the liturgy, this newly-formed language of ordinary intercourse, in its various dialects, was known from about the 8th century as the lingua Romana; and from this name, through the adverb Romanice, came the term Romance, applied both to the language and to the popular Latin written in it, more especially to the dialect and poems of the troubadours. The Romance languages recognised by Diez are six: Italian, Spanish, Portuguese, Provençal, French, and Roumanian. Ascend and newer investigators treat the Romance of the Grisons as a seventh sister-tongue; and each of these have more or less numerous dialects.

According to the theory of Raymonard, the new language that sprang out of the corruption of the Latin was at first essentially the same over all the territories occupied by the Romans, and is preserved to us in a pure state in the Provençal, or language of the troubadours; and it was from this as a common ground, and not from the original Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by all investigators. Its groundlessness was demonstrated by Cornwall Lewis. It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superadded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, as was to be expected, is richer in German words than any other member of the family, having 450 for every 100 in the other tongues. French, however, is not in this respect, but on the whole is nearest to the mother Latin. Spanish and Portuguese have considerable Arabic elements; and Roumanian was much modified by Slavie. The Romance tongues further differ from the common parent in simplifying or dropping the inflections of nouns, substituting for these the use of prepositions, and simplifying the verbal forms by a free use of auxiliary verbs. The six great Romance tongues and their literatures are treated in the articles on Italy, Spain, Portugal, Provence, France, and Roumania, to which may be added the Romansh.

See Cornwall Lewis, On the Origin and Formation of the Romance Languages (24 ed. 1682); Diez, Grammatik der Romanischen Sprachen (1836-38; 4th ed. 1877), and his dictionary, the great Wörterbuch (1853; Eng. trans. 1874); Gregorovius, Geschichte der Philologie Romane (1874); works on Romance philology by Körting (1884), Gröber (1886), and Neumann (1896); the magazine 'Romantische Studien' (1871 et seq.), and that of Gaston Paris, 'Romantica' (1873 et seq.).

Romances. Romance has long since lost its original signification in every country except Spain, where it is still occasionally used in speaking of the various languages. It was in the time of the old Latin was the language of the lettered classes and of documents and writings of all kinds. But even there its commoner application is, as elsewhere, not to a language, but to a form of composition. In English it has been almost invariably applied to a certain sort of prose fiction, and, in a secondary
sense, to the style and tone prevailing therein. But the romances, in the sense in which we generally mean the prose fictions which, as reading became a more common accomplishment, took the place of the lays and Chansons de gestes (q.v.) of the minstrels and trovâtres, and were in their turn replaced by the novel. Of these the most important stories were those which combined elements of chivalry, which may be considered the legitimate descendants of the Chansons de gestes. The chivalry romances divide naturally into three families or groups: the British (which, perhaps, would more properly be called Anglo-Celtic, as they are of Norman or Anglo-Norman), the French, and the Spanish; the first having for its centre the legend of Arthur and the Round Table; the second formed round the legend of Charlemagne and the Twelve Peers; and the third consisting mainly of the Romance of the Three Gauntlets, which was set among the imitations and imitations of one kind or another. In strict chronological order the Charlemagne cycle should stand first, for the Charlemagne legend was apparently of an earlier formation than the Arthurian; but on the other hand the materials out of which the Charlemagne romances were made are, comparatively speaking, the younger, and the prose romances which either grew out of it or were grafted upon it are for the most part of an earlier date than those belonging to the Charlemagne story.

The first appearance of Arthur is in the history of the Bretons in twelve successful battles fought with the Saxons; but it is in the Historia Regum Britanniae of Geoffrey of Monmouth (1140) that he first appears as the hero of a round table. Geoffrey himself, in fact, may be fairly claimed as the founder of the Arthurian legend. Whatever his materials may have been or whatever the source from which he obtained them, he contrived to give them "un caractère chevaleresque et ctoir" to use the words of M. Gaston Paris, which was altogether foreign to them when they came to his hands, and thus succeeded in presenting a picture of Arthur and his court which at once proved acceptable to the age in which he lived. It is this character, impressed upon the Arthur legend by Geoffrey, that was presented to us by the Anglo-Norman one. It was Arthur, head of chivalry and chivalry romance, as he does in Don Quixote (part I, chap. xiii). The story, however, as Geoffrey left it, is little more than the foundation of the structure raised by his successors a century later.

Whether we attempt in its entirety or in part only his account of the 'very ancient book' from Brittany which he professed to have translated, or hold that his authorities were simply Nennius, Welsh traditions, and Breton lays and tales, it is clear that his sources of information conveyed no hint of the Round Table or of the Grail, to say nothing of Lancelot and other personages who have come down to us as part and parcel of the Arthurian story. The first reference to the Round Table is in the Brut of Wace (1155), which is in fact an amplified metrical version of Geoffrey's History, and from the words used by Floris, Artus la roonde table, dont Breton dient mainte fable—we are left to suppose that it was through Breton tradition that it found its way into the story. By some it has been conjectured that in the Old French volsels endowed itself imperiously in the Peers of the Charlemagne legend, but in truth the two institutions represented two totally distinct ideas. The peers were simply a fraternity, "xii. companions," as the Chanson de Roland calls them, bound together by mutual affection although in Charlemagne the Grail is wholly unimpressed by the sovereign. The Round Table, on the other hand, was a knightly fellowship in which the bond of union was the pursuit of chivalrous adventure and "deeds of prowess," of which the king was the head, and by which he was "upborne" and the quiet and rest of his realm insured. The distinction deserves notice, for it is characteristic of the difference between the two legends and the romances that represent them. The Arthurian romances were purely and completely chivalric; the Grail was reserved for courtiers, sometimes knights—if we may trust the statements of early editors, they were written to order at the instance of magnates, among whom Henry II. and Henry III. of England are named, and at any rate addressed to what would now be called the "aristocracy of society." With the Carlotvingian it was very different; the Chansons de gestes from which they were derived were made for and sung to no one class in particular, and it is manifest that the selection for translation into prose was always governed by considerations of popular interest. Hence the phenomenon noticed by more than one observer, that the Arthurian stories have never become in the strict sense of the word popular in any age or country, while the Carlotvingian have enjoyed a wide-spread popularity, and in many cases have continued to hold their own as popular stories down to the present day. Mr. J. A. Symonds observes that in Italy the Arthurian stories, though relished by the cultured classes, never took the fancy of the people at large in the same way as the Carlotvingian; and in Spain the romances and ballads of that treat of Arthur are few and meagre, while the Charlemagne literature is extensive and rich, and the History of Charlemagne and the Twelve Peers is still a current châp-book in high request. At any rate, no obscure question is how the Holy Grail came to be linked to the Arthurian story. There can be no doubt that Celtic tradition and mythology present sufficient analogies to justify a theory that the idea of the Grail is a purely Celtic one which may be traced back to pagan times. But none of these analogies is that of the healing cup or the mystic basin which figures in Perceval, can be in any true sense called a Grail. The essence of the Arthurian Grail lies in its character of a Christian relic, and the very name suggests that the conception as it is there presented to us was an Anglo-Saxon one. It is possible, perhaps, that a difficult translation of Arthurian stories into Anglo-Saxon may have had a share in shaping the conception, but that is all that can be safely said. Some little light, perhaps, is thrown on the question by the curious coincidences between the Grail and the Holy Grail in a vision in the year 717, which Robert de Borron (circa 1190) sets up as the prime authority for his Saint Grail, and the vision in the same year in which the Grail itself was seen by a British hermit, as recorded by Helimaud in 1204. The return of the first Crusaders stimulated that enthusiasm for relics of the Passion of which we have a proof in the Sacro Catino at Genoa and its rivals. A very natural consequence would be an eagerness to discover the hiding-place of the true catino, and this, when the Round Table idea had been once imported into the Arthurian story, would give the Holy Grail an 'implicit bond of worship' par excellence necessary to its constitution, while an equally natural consequence would be that the poets in working out the idea would avail themselves of any floating traditions of mystic wine that could be pressed into their service. Arthur himself, no doubt, was treated in the same fashion. Hero-worship is almost always accompanied by annexation. The Charlemagne legend is largely made up of fragments that properly belong to Charlemagne, or to Bald. Even in the comparatively modern ease of the Cid, one of the most famous exploits, the unseating of the
French ambassador, is in reality the property of the 15th-century Conde de Cifuentes. It would be strange if so remote a figure as Arthur's conversion from heathenism to Christianity did not involve some process; but even if we find there, as Professor Rhys holds, traces of the culture of the hero, or of the solar myth, the question of his personality cannot be said to be thereby affected. It would be almost as unreasonable to treat him as a purely mythical being on account of the absence of any trace of human substance as to deny Sheridan's existence because jokes attributed to him are to be found in early editions of Joe Miller. There is very little certainty connected with the construction of the Arthurian story. It seems plain that the History of the Grail, which probably constituted the prequel, was in an earlier composition; and the respective shares of Chrétien de Troyes and Robert de Boron in the Grail, Percival, and Lancelot are pretty clearly defined. But in most other respects the Arthurian cycle deserves the title M. Gaston Paris applies to it of 'déda de incontrôlable.' In no case, as Mr Alfred Nutt says, do we possess a primary form; all the versions that have come down to us presuppose something earlier; all is uncertainty, the order in which the component parts were produced, the sources from which they were drawn, the authors by whom they were attributable, the relationships of the various versions and forms one to another; and research seems ever to reveal new nebulae and discover fresh clusters of difficulties. Even on the question as to whether the primary form was in verse, as analogy would lead us to expect, we are for the most part left to conjecture. That Breton popular poetry may have contained the germ of Tristan, Tristram, Percival, and Lancelot is no doubt a probability; but of one thing at least we may be certain, that veritable creations like the Lancelot of the Arthur story cannot take their place in the legend without which we have examples in the translated specimens of Marie de France. The stones may have come from a Celtic quarry, but the building was Anglo-Norman.

It was inevitable that the Arthur stories proper should be followed by romances, a supplemental or an introductory character, such as Melius, Guiron le Courtois, Artus de Bretagne, and Percéforest, but it would be an injustice to treat these, as Dunlop has done, as though they were legitimate members of the Arthurian cycle, nor have I even been able to include in it the works of the compilers or authors who have now and then attempted to present it in a consecutive shape. \textit{Faute de princes} of these is our own Sir Thomas Malory, whose work is, as Dr Sommer says in his masterly edition, 'by far the best guide to the Arthur romances in their entirety.' Malory's judgment may not be, perhaps, invariably impeccable. He has not always chosen the best or most poetical form, and he has left unexplored many beauties of the old MSS. This may not have been so much his fault as that of the materials with which he had to content himself. The lack of general knowledge and skill there can be as little question as of his English which has made his book one of the classics of his language. Malory, furthermore, as the exhaustive researches of Dr Sommer show, is the sole authority for portions of the series, in particular the story of Galien, with which he left a lacuna.

In the romances of the Chalirenge cycle we stand on much firmer ground. It is true that we know even less of the authors than in the case of the Arthur stories, but on the other hand the whole process of production lies plain to view. The result of the advent of the minstrelsy to the disaster of Roncevalles, and the Song of Roland—not, of course, the Chanson de Roland that has come down to us, but some other form, the existence and nature of which are matters of inference—may be taken as the foundation of the whole Chalirenge. And among the romances it is said that this, apparently, we have a prose version at the end of the Latin history of Charlemagne, which pretends to be the work of his contemporary the Archbishop Turpin. Nothing was farther from the intention of the writers than to produce a romanesque, but among the romance of the France at the head of them, their work must be placed. And if there be no mistake, By Charlemagne's example it points out the advantages here and hereafter of serving the church liberally and zealously, endowing holy shrines, encouraging pilgrimages, founding hospitals, or exterminating them when unconvincible. It records the pilgrimage to Compostella made by Charles at the call of St James, and is plainly the work of different hands. M. Gaston Paris believes the first five chapters to have been written by a monk of Compostella about 1050; but it is not very obvious why a Spaniard who had his own national legend of Compostella should have gone out of his way to make a patron of a foreigner and an invader. The remainder, he thinks, was written by a monk of Vieenne between 1109 and 1119. The book was soon translated into several languages, and became the source of the story of Roland and Roncevalles, for which it was believed to be the prime authority until the discovery of the chanson proved the existence of a common ancestor. The influence of the latter was mainly through the chansons de gestes of which it was in most cases the model. Of these the number is large. M. Leon Gautier's list enumerates above a hundred belonging to the Charlemagne cycle, and this of course only represents survivors. Only a few, however, gave birth to prose romances. The Roland had been forestalled by the Turpin history, and of the Roncevalles, as well as of the earlier, the local, not sufficiently popular, or for other reasons unsuitable for prose. The story of Ogier le Danois (who possibly had nothing to do with Denmark, but was merely warden of the Ardenne-mark) was too famous to be left in the verse of Aldeens le Roy; the traditions of the struggles between the royal line and his vassals in Aquitaine, not so much in Charlemagne's time as in Pepin's, lent an interest to Renaud de Montauban, the Rinaldo of Italian poetry, but best known as the hero of the \textit{Four Sons of Aymon} (q.v.), a romance that has probably been wholly composed by the compilers or arrangers who have now and then attempted to present it in a consecutive shape. Of all the romances of this sort are our own Sir Thomas Malory, whose work is, as Dr Sommer says in his masterly edition, 'by far the best guide to the Arthur romances in their entirety.' Malory's judgment may not be, perhaps, invariably impeccable. He has not always chosen the best or most poetical form, and he has left unexplored many beauties of the old MSS. This may not have been so much his fault as that of the materials with which he had to content himself. The lack of general knowledge and skill there can be as little question as of his English which has made his book one of the classics of his language. Malory, furthermore, as the exhaustive researches of Dr Sommer show, is the sole authority for portions of the series, in particular the story of Galien, with which he left a lacuna.

romances linked with the Charlemagne cycle; Cleomades, or Climates, where Cervantes found the magic wooden horse, which by a lapse of memory he assigns to Pierre de Provence and Magalona, another romance of the same kind; Porteopenas de Blois; Melusina: The Knight of the Three Heads; Sagram, translated by Beaugues for his Speculum Historiale, from which it passed into the shape of a romance, and was translated into English at the instigation of Edward, Duke of Buckingham, who claimed to be one of the knight’s descendants.

Cervantes correctly claims Amadis de Gaula as the founder of Spanish chivalry romance, though he may have been in error as to its being the first work of the kind printed in Spain; the Valencian Tirant to Blanc must have preceded it. It was long hailed as the actual work of the great poet, but the statement of González de Azurara that it was entirely the work of Vasco de Lobeira; but there is ample proof that an Amadis was extant in Spain at least as early as the middle of the 14th century, very probably as early as 1300, but at any rate before Lobeira was born. Sometimes the history of its composition was not forthcoming, may be excused for asserting the Portuguese origin of the romance; but it is strange to find M. Gaston Paris still describing it as ‘portugais espagnol aux XV° et XVI° siècles.’ Whether this Amadis was in verse or in prose is uncertain; we only know from one witness that it was in three books, and Garei de Montalvo, who is responsible for the existing Amadis, merely claims to have corrected three books, which previous editors and scholars had left in a corrupt state, and to have added a fourth. Nor is it a certainty that it was of purely Spanish origin. The influence of the Arthurian romances is manifest, but what is far more suspicious is the absence of Spanish colour and indications of Spanish parentage; the names are almost all akin to those of the Arthur stories, the same theme is repeated, and the scene throughout is laid on Arthurian ground. Wales, England, Brittany, or Normandy, a choice not easily explained in a romance whose business was to interest Spanish hearers or readers. Whether or not the original may have been some northern French story, it certainly was known, as has sometimes suggested, Amadis y Yñoces in which there is no more resemblance to Amadis than there is in Ausassin and Nicelette.

The earliest known edition of the Amadis (q.v.) is of 1508, but this cannot be the first; it is too near the date of other romances obviously inspired by it and born of its success, and it is evident that it was finished shortly after the fall of Granada in 1492. The date is significant in its bearing on the curious phenomenon of the sudden outburst of chivalry romance literature in Spain, just as the middle ages were drawing to an end and other nations were beginning to put away chivalry among the brie-á-brac of hygine days. But in Spain it marked the close of a campaign of seven centuries and the end of a national life of sustenance under one rule. Under the circumstances, the triple despotic, of crown, church, and Inquisition, the nobles and minor nobility were left with a superabundance of leisure on their hands, a condition, as every sensible librarian knows, always favourable to the production of works. This is a point on which Montalvo could not have chosen a better time for his venture. But it would be unjust in the extreme to deny the meritorious Amadis their share in the creation of Spanish chivalry romance. In almost every respect, story, incidents, characters, and human interest, it will bear comparison with the best of its predecessors, and as a romance of chivalry, pure and simple, it has no equal. In this lay the secret of its success. For Spain chivalry romance had been entirely unknown elsewhere. Amadis came to a generation which, through the apocryphal and Isabella knights who could match any of Arthur’s or Charlemagne’s in exploits. Coming at such a time it is no wonder that Amadis was followed by a cry for more, and that more was produced, some of it by Fioravante, Floriart, Lisart, Amadis of Greece were of a very different vintage. It was by Belciano de Silva, the object of Cervantes’ special detestation, that the work of continuation was chiefly carried on. He was a clever man, with a facile pen, and if not imagination, at least invention in abundance, but his greatest gift was his intuitive perception of the tastes of his readers. He perceived that it was not so much recreation as excitement they wanted, and that so far from objecting to rant, bombast, and extravagance the more they got the more they pleased. He seems to have been the first author who reduced writing nonsense to a system, and also the first who made a handsome fortune by his writings. The professed continuations formed, however, only a small portion of the romances, nor was there an imitation in the original, and infected by the style of Belciano de Silva, the Felizmartz, Belianises, Olivarites, which continued to flow from the press until the long line ended with Pellecian de Boecia, two years before Don Quixote was sent to the press.

With Don Quixote, fittingly, the history of romances as a branch of fiction comes to a close. There are, indeed, two other groups that claim the title, the Pastoral, and those sometimes called the Heroic, an epithet better deserved by the readers who were bold enough to face entertainment in such a formidable shape. But to these quite as much space as their merits entitle them to has been already given (see NOVELS).

Roman de Rou. See WACÉ.

Roman Empire, Holy (more fully in German, Heiliges Römisches Reich Deutscher Nation), the official denomination of the German empire from 962 down to 1806, so that the last king of the empire, Francis II, resigned the imperial title. The Western Roman empire came to an end in 476 A.D.; Charlemagne sought to reconstitute it when he was crowned
Romans, George John, naturalist, was born at Kingston, Canada, on 20th May 1848, and after a private education in London and on the Continent entered Gains College, Cambridge, and graduated in science honours. While a student at the university he formed a friendship with Darwin, and he has powerfully reinforced his master’s arguments in his Croonian, Fullerian, and other lectures, and in his various works—Animal Intelligence (1851); Scientific Evidences of Organic Evolution (1859); Mental Evolution in Animals (1883); Jelly-fish, Star-fish, and Sea-urchins (1885); Mental Evolution in Man (1888); Darwin and after Darwin (1892); Examination of Weismannism (1893; see WEISMANN). This most fertile English writer on the theories and philosophy of modern biology, in a posthumous work, Thoughts on Religion, edited by Canon Gore, showed that, once a defiant agnostic, he had become almost, if not altogether, a Christian; and in this spirit he had before his death revised his Condensed Examination of Theism (1873). He was F.R.S. and LL.D., Life of Letters by his wife (1896), and his Poems (1896).

Romanesque Architecture, the delasped style which succeeded Roman architecture from about the time of Constantine (330 A.D.) till the revival in the 11th century. Roman Architecture (q.v.), itself a transitional style, fades gradually into the Romanesque. When Constantine gave the Christians freedom of worship, he gave architecture a new start; and noble buildings resembling the Roman Basilica (q.v.) were built as churches all over the empire. These consisted of three- or five-aisled halls—the aisles separated by rows of columns. In Rome the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains existed, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the aisles are always single columns, generally with caps intended to be Corinthian, and the arches are pointed, with stone or wooden roof; and there are remnants of entablatures, mouldings, &c., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the Myrsvva Medica (see ROMAN ARCHI-
ROMANS

ROMANTICISM

chap. xvi., which stands by itself, the epistle consists of two portions, marked off respectively by the doxology in xii. 36, and by the benediction in xv. 33. The first portion, which is mainly doctrinal, again falls into two sections—i.—viii. and ix.—xvi.—in the former of which the Pauline doctrine of justification by faith is explained. The need for a justification through grace and received by faith alone, if there is to be effectual justification at all, is elaborately shown, and the doctrine is vindicated, historically and experimentally, against controversial objections, first from the religious, and then from the natural point of view. In the second division of the first portion the disparagement and neutralisation of the divinely bestowed privileges of Judaism apparently involved in the preaching of this doctrine without restriction among the Gentiles are considered. The second, or practical, part of the epistle deals with points of Christian morality and problems of Christian tolerance.

The epistle is addressed to the Christians in Rome. Who these were—whether they were Jews or the followers of the Gentiles—whether they had come to be Christians, can only be conjectured. It is impossible to infer much about them or their circumstances from the epistle itself, for the church in Rome was not one with which the apostle, at the time of writing, was personally acquainted. More probably, the numbers or proportions the Jewish-Christian and Gentile-Christian elements existed within it; but he was warranted in assuming (as he seems to have done) that it contained both, and that the conversion of which he had heard, the only too familiar elsewhere might break out at any moment in Rome also. The epistle gives no support to the tradition that the church in Rome had been founded personally by Peter; but doubtless it had relations with Jerusalem, and so may well be believed to have owed something to his indirect influence, at least. The immediate object of the apostle Paul in writing to the Romans when he did is easily explained by the outward and inward circumstances through which, as we know, he was at the time passing. Having completed his preaching in the western empire, he intended to return to Jerusalem and Illyricum (xv. 19), he was purposeful to extend his apostolic activity among the Gentiles westward as far as to Spain; and with a view to his success in the new field it was only natural that the tone of the epistle should be that of a possible misconception of his teaching, and to prepare for it a friendly and sympathetic reception in the metropolis of the world.

The Pauline authorship of the epistle as a whole has never been called in question; indeed it is one of the four canonical epistles which, along with the Apocalypse, were regarded by Baur as the only quite indubitable relics we possess of the apostolic age. Baur, it is true (following Marxim), rejected chaps. xv, and xvi, regarding them as additions of the 2nd century. His argument was based chiefly on the supposed incomprehensibility of the introduction to the epistle and the possibility, to which Baur was disposed to attach the. whole passage, that it might be the result of a later hour. But the possibility of the genuine character of the various suggestions, both internal and external, which indicates that these chapters are somewhat loosely attached to the main body of the epistle; in some ancient copies it closed with xiv. 23, immediately followed by xvi. 25-27 (see Revised Version, margin). The argument is strengthened by the fact that various schools is that they consist of a postscript, or postscript, or (the view of Lightfoot) that at some period after the original composition and transmission of the epistle the apostle, in order to adapt it for a wider circulation, re-issued it with omission of the last two chapters, as also of the word Rome at the beginning. Schultze in 1829, following up a hint of Semler (1769), suggested that xvi. 1-20 was really a fragment of a Pauline epistle to the Corinthians in the light of the various modifications, has been accepted by very many critics, among whom may be mentioned Reuss, Renan, and B. Weiss. See the introductions of Reuss (6th ed. 1887), B. Weiss (2nd ed. 1889; Eng. trans.), and Holtmann (2nd ed. 1893) for these views, and their development by Philipps, Jewett, Goshed, Gifford (in Speaker's Commentary), Monle (in Cambridge Bible), Liddon (1895), Lipsius, and Sanday and Headlam (1896).

Romansch (Ger. Schwedisch, from the town of Chur), a name applied to the Romance dialect, or rather amalgamation of cognate dialects, spoken from the Grisons to Friuli on the Adriatic. Ascelin includes all varieties under the common name of Laotino, although strictly that term applies to the dialect of the Engadine, as distinguished from that of the upper Rhine valley. There are dictionaries by Couradi (Zur, 1829) and Carisch (Chur, 1821). See also J. Ulrich's Rhätoromanische Christenmärche (1852-83) and Rhätoromanische Texte (1883-84).

Romanticism (through the adjective romantic, from romant or romani), a term applied to the feelings and thought that has transformed the literature and art of most nations, has been defined by Dr Theodore Watts as 'the renascence of the spirit of wonder in poetry and art.' It was a revolt against pseudo-classicism; a return from the monotonous commonplace of everyday life to the quaint and unfamiliar world of old romance; a craving for the novel, original, and adventurous; an empressing of the interesting, the picturesque, the 'romantic,' at the expense, 'if need be, of correctness and elegance, and the current canons of 'good taste.' Deep humour, strong pathos, profound pity are amongst its notes. Romanticism is not necessarily limited to any one period; there are romantic elements in Homer, Æschylus, Sophocles; the poetry of Dante is eminently romantic when contrasted with the classical poet, and that of Milton; but though what is romantic for one generation tends to become classic—and so tame, though not really insipid—for a later one, and though the romantic is almost inevitably one side of a truly artistic temperament, there are special romantic epochs, e.g. in the 18th century, in certain writers in those epochs more romantic than their fellows. The 18th century was notoriously classic in ideal, or pseudo-classic—conventional, pedantic, academic; and the revolt against spiritual ennui which followed is the romantic movement pur excellent. The movement arose under various conditions in the several countries, had a somewhat varying character and course, and sometimes tended towards the merely crude and grotesque. In England, the fountainhead of the movement which culminated in the beginning of the 19th century, and that 'hearts and Drang' period was largely romantic in its temper; but it was Novalis who was the prophet of 'romanticism,' and among the other representatives of the school were the Schlegels, Tieck, Kleist, Fouqué, and Hölderlin. The beginnings of romanticism are traced by Rousseau in Chateaubriand, and others; but the great chief of French romanticism is Victor Hugo. Other French romantics are Lamartine, Dumas, Gautier, George Sand, Flan bert,
Mürger. The romantic movement in the three countries is discussed in the articles on the literature of each (English Literature, Vol. IV. p. 375; Germany, Vol. V. p. 188; France, Vol. IV. p. 789). The other countries were more or less moved by the same spirit; see also the articles on the literatures of the principal countries. The influence of Percy's Reliques is traced in the article Ballad. In Germany romanticism included the love of the medieval an affection for the oriental; in religion it led some of its notable representatives to Catholic ideals and into the Catholic Church; and in politics it was associated with reactionary conservatism. The aims of the romantics in painting are defined at Painting, Vol. VII. p. 700; see also Pre-Raphaelitism. In music Weber has been called the 'creator of romantic opera'; but see Opera, Vol. VII. p. 608. Berlioz is regarded as the type of French romanticism in music.

See (under Idea) Idealism, Realism; Pater in Macmillan's Magazine, vol. xxxv.; for Germany, the works by Julian Schmidt (1848), Haym (1871), Brandes (1873); for France, Stendhal, Racine et Shakespeare (1823); Gautier, Histoire du Romanticisme (4th ed. 1884); and many essays by Sainte-Beuve and Scherer.

**Romany.** See Gypsies.

**Rome,** the capital of the modern kingdom of Italy, stands on the Tiber, about 15 miles from its mouth. Roman legend ascribed the foundation of the city to Romulus, at a date corresponding to 753 B.C. But recent explorations have proved that the site was inhabited in the neolithic and early bronze period. The existence of a town with a considerable population at a time long before the date ascribed by tradition to the foundation of the city has been established by the discovery in 1874 of a cemetery on the Esquiline, near the railway station, which contained pottery of the type usually assigned to the 9th or 10th century B.C. In the time of the kings (753-510 B.C.) the city occupied seven hills, whose summits rise from 80 to 120 feet above the river and the intervening valleys. These hills are believed to have been formed by subaerial erosion of beds of soft tufa previously erupted by submarine volcanoes. Of these seven hills— the Palatine, the Capitoline, the Aventine, the Caelian, and the Esquiline—being more or less isolated, were termed *Montes,* and two, the Quirinal and Viminal, being mere spurs jutting out from the tableland to the east, were called *Colles.* The Esquiline, however, is properly rather a Collius than a Mons, being connected with the tableland by a narrow neck. The Palatine and the Capitoline, being the most defensible sites, were doubtless the first to be occupied, and this accords with the Roman legend, which makes the Palatine the site of the primitive city founded by Romulus, the Capitoline being occupied by a rival Sabine

![Map of Ancient Rome](https://example.com/roma_map.jpg)

Map of Ancient Rome:
The positions of a few of the more important modern places of interest are also indicated; the ancient names being given in Italics and the modern in Roman letters.

settlement which, under Tatius the Sabine king, soon extended to the Quirinal, a contiguous spur of the tableland, separated only by a narrow valley from the Capitoline. We are also told that the Aventine, which after the Palatine and the Capitoline was plainly the most desirable site, was occupied by a colony of Latins in the time of Ancus Martius, the fourth king. Under Servius Tullius, the sixth king, the Esquiline, together with the Viminal, which is a mere spur of the Esquiline, is said to have been added to the city. These legends conform to the probabilities of the case.

The settlement on the Palatine attributed to Romulus was fortified at a very early period,
possibly about the date assigned to the foundation of the city. Remains of this earliest wall have been discovered in the course of recent excavations. The stone walls were squared, and a related wall, consisting of large stones fitted together without mortar, was built up from the base of the slope, rendering the hill almost impregnable. The Palatine was thus made into a sort of artificial plateau, with the marshy hollows between them, thus enclosed. The rampart was raised, or agger of earth, faced with an exterior wall of unmortared masonry, which is still in one place 50 feet in height, with an inner retaining wall of similar construction. Outside the rampart was an enormous fosse, which from recent excavations appears to have been in some places 30 feet in depth and 100 feet in breadth, from which the materials for the agger were obtained. In the construction of this rampart the older walls, which ran along the crests of the Palatine and Capitoline hills, were retained, and the agger can only be traced where it crossed the intervening valleys, or where it protected the spurs where they joined the tableland. The agger, begun probably by Tarquinius Priscus, has received the name of Servius Tullius, by whom probably the agger was extended, and the Esquiline was completed. At a considerable distance from this agger may be conveniently examined in the goods yard of the railway station. An excellent cross-section is exposed on the northern crest of the Quirinal in the Via di S. Andrea. The agger, which may be traced in the gardens of the Barberini and Colonna palaces, is cut by most injury employed in the construction of roads, and the remains of the agger may also be seen in the valley below the southern slope of the Aventine.

For 800 years, till the reign of the Emperor Aurelian, the Servian agger formed the only defence of the city. The wall which bears the name of Aurelian is to a great extent identical with the present walls. It enclosed the suburbs which had grown up beyond the Celian, the Esquiline, the Quirinal, and the Capitoline hills, and included the agger. The Servian agger of the Esquiline was completed. It was restored and partially rebuilt by Honorius and repaired by Belisarius. It is 12 miles in circuit. The Leonine Wall, enclosing the Vatican Hill and the remainder of the Janiculum, was built by Leo IV, in 848. In 1227 some additional space on the Vatican was enclosed, and bastions to strengthen the weak parts of the old wall were added. At the present time populous suburbs have arisen to the east and north beyond the walls, while to the south extensive spaces on the Vatican were enclosed, and bastions to strengthen the weak parts of the old wall were added. In 1888 no less than 1465 acres, chiefly on the Celian and the Aventine, were occupied by vineyards, fields, and gardens, while public gardens and squares occupied 106 acres.

To the period of the kings belongs the Cloaca Maxima, a large subterranean sewer of Etruscan masonry, which drained the marshy hollow between the Capitoline, Palatine, and Esquiline hills. A portion of this valley became the Forum Romanum, at once the market and the place of political meeting for the Romans, Sabine, and Latin tribes, who occupied the surrounding hills. The Cloaca Maxima (q.v.), though the oldest and best known of the sewers, is rivalled in magnitude by two other ancient sewers which enter the Tiber nearly opposite the same point. The well-known Mamertine prison at the foot of the Capitol, now consecrated as the submarine church of St. Pietro in Carceri, was a deep vaulted well from which, and from the Tiber, the water-supply must have been obtained during the Roman period. The Tiber was supplied with water by aqueducts from the Alban hills and the Apennines this well, perhaps the most ancient structure in Rome, was converted into a dungeon, in which state-prisoners, among them Jugurtha and the Catiline conspirators, were confined, by way of punishment. In the period of the Empire the well was, as is known, ever confined here a mere legend, of no authority or probability.

In the great aqueducts we have the most notable remains of the Republican period. The oldest was the Aqua Appia, constructed by Appius Claudius Censor in 312 B.C., which brought water from springs upwards of seven miles distant from the city. The Anio Vetus, 43 miles long, was commenced in 275 B.C., and brought water from the river Anio. The Aqua Marcia, 62 miles in length, was constructed by M. Tarpeius, and completed about B.C. 127, or 121 years after the aqueducts from the Alban hills at a level sufficiently high to supply the Capitol. The Aqua Julia, the Aqua Claudia, and the Anio Novus, constructions even more gigantic, date from the imperial age. Altogether there were fourteen of these aqueducts, each with an aggregate length of 481 miles. The Romans employed vast structures, striding on the arches across the Campagna, and still bringing copious supplies of water from the Apennines and the Alban hills, are among the most striking features of modern Rome. A portion of one of these aqueducts was in use until 1870, when the Aurelian Wall, the arches being simply built up with masonry. The remains of the enormous arches by which the water of the Aqua Claudia was brought across the deep valley between the Celian and the Palatine also exhibit the vast scale of these erections (see AQUEDUCT).

In the time of the Republic the centre of the public life of the city was the Forum Romanum, an oblong space, containing about 23 acres, surrounded by shops (tabernae). It was traversed by the Via Sacra, a width of 300 feet, along which the processions passed to the Capitol. The great blocks of lava with which this road was paved still, for the most part, remain in situ. The Temple of Vesta and the House of the Vestal Virgins stood on one side of the Forum, the Palatine, and on the other side was the Regia, or House of the Pontifex Maximus. Close by were the rostra, the beaks of captured Carthaginian ships, between which was the platform from which orators harangued the people. Further to the north-east was the Senate House, whose walls are preserved in those of the church of S. Adriano; the neighbouring church of Ss. Luca e Martina being constructed out of the offices of the Senate House. Beyond the Senate House stood the Treasury and the Tabularium. In course of time the open space of the Forum became occupied with stately public edifices, of which the most conspicuous remains are the eight columns of the Temple of Saturn, built in 401 B.C., the Colonnade of the Twelve Great Gods (deorum consuetum), the Temple of Vesta, the Temple of Castor and Pollux, in 496 B.C., of Vesta, of Julius Caesar, of Vespasian, and of Faustina. We see also the foundations of the Triumphal Arch of Augustus, the vast ruins of the Basilica Julia, the base of the column of Phocas, and the milestone from which all Roman roads were measured. To the north of the Forum stands the Triumphal Arch of Septimius Severus,
to the south the Arch of Titus (see ARCH). So much of the open space of the Forum became occupied by great public monuments and edifices that in the time of the emperors additional fora were required. These were erected on the eastern side of the Forum Romanum. Of the Forum Julianum only three arches of the outer wall remain. Of the Forum of Augustus a portion of the enclosing wall, a massive archway, and three columns of the Temple of Mars Ultor, which stood within the Forum, now cleared of rubbish, are among the most imposing and accessible remains of the architecture of the early empire. Of the Forum of Nerva two columns may be seen in the Via della Croce Stadium the most perfect in existence, imperial reception-halls, several temples, with gardens, baths, barracks for soldiers, and a basilica or hall of justice, in which St Paul must have pleaded before the emperor. The Golden House of Nero, built on the opposite side of the Forum, and occupying the greater portion of the Oppian Hill, was demolished to make room for the Colosseum and the Baths of Titus, so that practically nothing is left save some substructures, the cisterns known as the Sette Sale, and the base of the colossal statue of Nero, which stood in front of the Golden House.

Of the numerous temples in Rome, of which there are said to have been three hundred, the naves and in many cases the sites, of 133 are known. The foundations of the great Temple of Jupiter Capitolinus may be traced in the gardens of the Caffarelli Palace, now the German embassy. Of the temples which remain the preservation is due in several cases to their having been converted into churches. The columns in front of the church of S. Lorenzo in Miranda, which faces the Forum, formed part of the Temple of Antoninus and Faustina. Ten columns of the Temple of Ceres are built into the walls of S. Maria in Trastevere. S. Maria del Sole is a round temple formerly called the Temple of Vesta, but now believed to be the Temple of Hercules Victor. Another temple, supposed to be the Temple of Fortuna Virilis, is now the church of S. Maria Egiziaca. The church of Ss. Cosmo e Damiano is the Temple of Aurora Urbs, erected by the Emperor Maxentius.

In the center of the Temple of Venus and Rome, built by Hadrian, is preserved in the church of S. Francesco Romana. It is believed that the church of Ss. Sergio e Bacco was the Temple of Concord, that the church of S. Stefano Rotondo was the Temple of Mater Matuta, and that of S. Nicola in Ariccia was the Temple of Piety; while Santa Maria in Trastevere Minerva stands on the ruins of a Temple of Minerva, S. Maria Liberatrice probably occupies the site of a Temple of Vesta, and the round church of S. Teodoro was a temple of unknown attribution. In 27 b.C. Agrippa built a vast dome in front of the Temple of Mars which he erected in the Campus Martius. It is called by Pliny and other writers the Pantheon, and may have served as a sort of entrance-hall to the Temple. In 608 it was consecrated as the church of S. Maria ad Martyres, and now goes by the name of S. Maria Rotonda. All the buildings of ancient Rome have since been entirely rebuilt or altered. The diameter of the dome, which is lighted only by a central aperture in the roof, is larger than the dome of St Peter's; the walls, 10 feet in thickness, have deep niches which were filled with statues of deities; and the floor is of Purpurian and Numidian marbles, with porphyry and siller as slabs.

The Thermus of Agrippa, of which the Pantheon is the only portion that remains, were the earliest of the eleven great public baths which formed so characteristic a feature of imperial Rome. The Thermus of Trajan, mentioned by Tacitus, built on the site of the Golden House of Nero, occupied almost the whole of the Oppian Hill; but of these baths little is left save the foundations. On the slope of the Quirinal stood the Thermus of Constantine. In the Piazza del

The Forum Romanum at the present time.
Quirinal stand two colossal horses from the thermae which occupied the site. In the formation of the steps which lead down from the piazza, and of the Via Nazionale, substructures belonging to these thermae were discovered, and portions of their massive walls may be seen in the gardens of the Colonna and the Casino di Pincio. At the other end of Rome, on the low ground south of the Caelian, are the ruins of the Thermae Antoninianae, usually called the Baths of Caracalla, by whom they were begun in 212 A.D., and completed by Alexander Severus. They were built to accommodate a large population and to show the magnitude of the projects, as a quarry, are still the vastest, and in their desolation perhaps the most impressive, of all the ruins in Rome. The lofty walls are still standing, and, as the halls have been cleared of rubbish, the arrangements of Roman thermae (see BATH) can here best be studied. We see the Calidarium, the Tepidarium, and a Frigidarium, with an Exedra and a Stadium or racecourse. The outer wall encloses a space of nearly 27 acres, of which the baths themselves occupy more than 6 acres. Farther on still lies the Thermae Diocletian, on the summit of the Quirinal, designed to accommodate 3000 bathers. The semicircular curve which forms such a conspicuous feature in the Piazza delle Terme was the exedra of these baths. One of the smaller circular halls forms the church of S. Maria degli Angeli, which is converted by Michelangelo into the magnificent church of S. Maria degli Angeli. Another hall is used as a prison, another as a fencing-school, others serve as barracks, stables, coach-houses, and warehouses for timber, while the cloisters of a Carthusian convent built out of the ruins are now converted into a museum.

A large marshy plain, which now forms the most densely populated part of Rome, lay outside the Servian Walls, extending from the foot of the Capitoline and Quirinal hills to the Tiber. This, being used for military exercises, was called the Campus Martius. Towards the close of the republican era this suburban plain began to be used in the formation of public buildings, such as bath, theatres, and racecourses. These were connected by the Porticae, a network of colonnades forming covered walks, serving as a protection alike from the sunshine and the rain, along which the citizens could stroll to the various places of recreation and amusement. The Campus Martius was traversed by the Flaminian Way, approximately represented by the modern street called the Corso, which was bordered on either side by the stately tombs of Roman nobles, and spanned by the triumphal arch of Claudia, and by that of Marcus Aurelius, demolished in 1662. On these fields were built the Baths of Agrippa and the Baths of Nero. Here was erected the Theatre of Balbus and the vast Theatre of Pompey, said to have contained seats for 40,000 spectators. This last was renamed the Theatre of the Scipios and is seen behind the church of S. Andrea della Valle. Somewhat nearer to the Capitol was the Theatre of Marcellus, which a considerable portion still stands, forming one of the most characteristic examples of Roman architecture of the best period. This was included with the Theatre of Agrippa, and finished in the year 11 B.C. by Augustus, who named it after his nephew Marcellus, the son of Octavia. In the 11th century, like the Colosseum and the Mausoleum of Hadrian, it was turned into a fortress by the family of the Orsini-Savelli. The interior is now occupied by the Palazzo Orsini-Savelli, while the outer arches are used as rag-shops and smithies.

In the same characteristic Roman style as the Theatre of Marcellus, but of a more debased type, is the great Flavian Amphithetre, built for gladiatorial exhibitions and for the combats of wild beasts, which goes by the name of the Colosseum. Commenced by Vespasian, it was dedicated by Titus 80 A.D. It is called the Flavian or the Domitian. It is built in the form of an ellipse, the longer diameter measuring 135 feet and the shorter 510 feet. It rises to a height of 160 feet, covering five acres of ground. In the middle ages it was used as a fortress and afterwards as a quarry; but, though so long looted and almost destroyed, it is perhaps the most imposing monument of Roman magnificence which is left (see AMPHITHEATRE). The earlier amphitheatres were mostly of wood, and have perished. The Piazza di Monte Citorio on the Corso is believed to occupy the site of the Amphitheatre of Statilus Taurus, erected in 31 B.C., the foundations having been found 88 feet below the present surface of the street. At the side of the church of S. Croce in Gerusalemme are considerable remains of the Amphitheatre of Caligula (see CAESAREA). This was utilized in the construction of the Aurelian Wall, from which it protrudes, forming a sort of semicircular bastion. Below was the Circus of Elagabalus, from which came the Egyptian obelisk now in the Pincian Gardens.

The oldest circus was the Circus Maximus, in the valley behind the Palatine Hill. It is supposed to date from the regal period, but was enlarged by Julius Caesar. It was about three furlongs in length and one in breadth, nearly the size and shape of Eaton Square, and is said to have been capable of seating 250,000 spectators. The site is now occupied by the Jewish cemetery and the gas-works. The arrangements of a Roman circus can best be studied in the well-preserved circus on the Appian Way, near the tomb of Cecilia Metella, built in 311 A.D., which usually bears the name of the Emperor Maxentius, but is more correctly assigned to his son Romulus. It is 330 yards long and 86 broad. The mete, the spina, the course, and the seats for the emperor and the spectators may still be traced. An Egyptian obelisk from this circus now adorns the Piazza Navona (see CIRCUS).

Of the Circus of Flaminius, built in 220 B.C. on the Campus Martius immediately below the northern slope of the Capitoline Hill, no vestiges remain. The same is the case with the Circus of Nero on the Vatican, which occupied the hollow between S. Peter’s Church and the Vatican Gardens through which the visitor now drives to the Vatican Museum. While the circus was designed for chariot-races, the stadium was used for foot-races. Of these there were several, but the Imperial Stadium on the Palatine, between the house of Augustus and the buildings of Septimius Severus is the only one which remains in a tolerable state of preservation. The Stadium of Domitian on the Campus Martius is believed to be represented by the present Piazza Navona, recently renamed the Piazza di Barberano; the modern theories are about the size and shape of St George’s Square, Pimlico, or the site of the Houses of Parliament.

The roads leading out of Rome beyond the Servian Walls were bordered by tombs, many of which, on the erection of the Aurelian Wall, were included with the city. On the Appian Way (q.v.) are the tombs of the Scipios, the inscriptions on which, forming the earliest contemporary records of Roman history, are among the treasures of the Vatican. Farther on four ancient columbiae have been identified, the most famous of which is the Tomb of Cecilia Metella (see ROMAN ARCHITECTURE), wife of the triumvir Crassus, which in the 13th century was converted into a fortress.
by the Gaetani family. It is a cylindrical block of masonry, 65 feet in diameter, resembling the keep of a feudal castle. Another remarkable tomb is the Pyramid of Caius Cestius in the Via Ostiensis. The most magnificent of Roman tombs was the Mausoleum of Hadrian, now the castle of S. Angelo. It was a cylindrical tower of masonry, 340 feet in diameter and 163 feet in height, surmounted by a colossal statue of the emperor. When the Goths besieged Rome the tomb was converted into a fortress by Belisarius. It afterwards became the castle of the popes, and citadel of Rome, and in 1527 was defended against the French by the Popes' and the Tiber. From the remains of the Colosseum, which stood behind the great church of S. Carlo al Corso. In the middle ages it formed the castle of the Colonna family, and is now occupied as the Teatro Corea. Two obelisks of Egyptian granite faced the entrance, one of which now stands in the Piazza di S. Maria Maggiore, and the other fronts the Palace of the Quirinal. In all there are eleven Egyptian obelisks which ornament the gardens and piazzas of Rome. Two stand near the Pantheon, and stand in front of the church of San Siro; another, before which they were originally erected. Another, now in the Piazza del Popolo, was brought from Heliopolis by Augustus, and placed in the Cireus Maximus. That in the Piazza di Monte Citorio was also brought to Rome by Augustus. That in the Piazza of S. John Lateran, 104 feet in height, is the largest in existence. It was erected at Thebes by Thothmes III., and removed by Constantine to the Cireus Maximus. The obelisk in the Piazza di S. Pietro was brought from Heliopolis by Caligula, and placed in the Cireus of Nero, now called the Esquiline. On the Pincian is an obelisk of Hadrian; and there is another in the gardens of the Villa Mattei.

Of the triumphal arches those of Augustus, Tiberius, Claudius, Marcus Aurelius, and Trajan have disappeared. The Arch of Septimius Severus, which spanned the Sacred Way just as it began to climb the Capitol, remains in a fair state of preservation. At the other end of the Forum, also spanning the Sacred Way, is the Arch of Titus, with the well-known reliefs representing the spoils from the Temple at Jerusalem (see Arch). A short distance westward along the Appian Way stands the Arch of Constantine, fronting the Colosseum and the three huge arches of the Constantine Basilica. The so-called Arch of Drusus crosses the Appian Way where it passes through the Aurelian Wall. The Arch of Dacia, built in 18 A.D., is almost hidden in the brickwork of the Aqueduct of Nero, called the Aqua Claudia; and the Arch of Gallienus on the Esquiline, erected in 262 A.D., is in the degraded style of the time. See Arch (Triumphal). The bridges over the Tiber and the other three are survivals of the eight or nine ancient bridges. The oldest is the Pons Fabricius, built in 62 B.C. by L. Fabricius, leading from the city to the island in the Tiber. The Pons Cestius, believed to have been built by the Emperor Gratian, leads from the city to the right bank of the Tiber, and the Pons Aelius, now called the Pons S. Angelo, was built by Hadrian in 135 A.D. in front of his Mausoleum, and now serves as the approach to St Peter's and the Vatican. The Ponte Rotto, or 'broken bridge,' was part of the Pons Aemilius, but no picture remains till the recent 'improvements.' It is now replaced by a suspension bridge. The Ponte Sisto was built by Pope Sixtus IV. to replace the Pons Aurelius.

Modern Rome.—It is impossible within moderate limits to give an adequate account of Rome, which contains more objects of interest than any other city in the world. A bare enumeration of facts must therefore suffice. The Observatory in the Collegio Romano is situated in 41° 53' 32" N. lat. and 12° 28' 40" E. long. The population was 226,622 in 1870; 272,560 in 1876; 300,467 in 1881; 401,044 in 1886; 417,036 in 1891. The walls, which enclose 3860 acres, are 14 miles in circuit. Of the fifteen gates, two of which are closed, since 1870 more than 3000 new houses have been built, 52 miles of new streets have been formed, and 51 millions sterling have been spent by the municipal on the improvement of the city. During the progress of the railway into Rome, 1873-85, there were 2560 lamps, 191 marble statues, 266 busts, and 36,770 coins have been found. There are twelve bridges, five of which are old, and the rest comparatively new. The chief gates are the Porta del Popolo and the Porta Pia on the east, the Porta S. Lorenzo and the Porta Maggiore on the west, the Porta S. Sebastiano and the Porta S. Paolo on the south. Old Rome stands on the left bank of the Tiber; on the right bank, occupying the Vatican and Janiculum hills and the low ground between these hills and the river, are St Peter's, the Vatican Palace, the Vatican, and the Tiber. The chief part of the city occupies the plain on the left bank between the hills and the river, traversed by the Corso, the principal thoroughfare of Rome, about a mile in length, leading from the Porta del Popolo to the foot of the Capitoline Hill. From the Piazza del Popolo to the gate of Montecitorio, on the left side of the Corso, the Via di Ripetta to the right, skirting the Tiber, and to the left the Via del Babuino, leading to the Piazza di Spagna, whence the Scalo di Spagna, the resort of artists' models, ascends to the Pincian Gardens, on the site of the gardens of Lucullus, which commanded the Identify the city, and form the fashionable drive and promenade of the Romans.

Before Rome became in 1870 the capital of Italy, the greater part of the Pincian, Quirinal, and Esquiline hills was occupied by villages of the Roman nobles, with extensive gardens planted with box and vines. With two exceptions these have been destroyed, and their sites have been covered with modern houses, and too often by blocks of ugly barnack-like buildings, many stories in height, let out in tenements. The two picturesque and picturesque hills are assuming the aspect of modern capital, broad, straight thoroughfares having been driven through quarters formerly occupied by narrow streets and mean, crowded houses. Of the new streets the most important are the Via Venti Settembre, from the Porta Pia to the Quirinal, and the Via Cavour and the Via Nazionale, which lead from the railway station, the first to the Forum, and the second to the lower end of the Corso. This is continued to the west by the Corso Vittorio Emanuele as far as the Borgo, crossing the Tiber by a modern bridge fed by the railways, and lay at the foot of the Pincian, around the Piazza di Spagna, but the healthier sites on the slopes and summits of the Quirinal and Esquiline are now more frequented.

Of the palaces the largest are the Vatican, the residence of the pope, the Lateran, the ancient residence of the King, but formerly a papal palace, in which the conclaves were held for the election of the popes. Many of the palaces of the Roman nobles contain collections of pictures and statuary. Chief among them are the Palazzo Borghese, containing the most spirited collection of pictures in Rome, the Palazzo Colonna, Doria, Barberini, Rospigliosi, Chigi, Torlonia, Farnese, Corsini, and di Venezia, now the Austrian embassy. Among the notable villas are the Villa Borghese, standing in a great park below the
Pincian; the Villa Ludovisi, on the Pincian; the
Villa Albani, outside the Porta Salaria; and the
Villa Medici, on the Pincian, now the Academica
Filibrighth, in a splendid collection of casts of
the gardens of the Villa Mattei, on the Caelian, com-
mand one of the best views in Rome. The pictur-
esque arches of the Aqua Claudia traverse the
gardens of the Villa Wolkonsky.

Besides the private collections Rome abounds in
public collections. The most important of these is
Collegio Romano, formerly a Jesuit college, is now occupied by a public library of modern books called the
Biblioteca Vittorio Emanuele, and the Kircherian
Museum of Antiquities, and by a well-arranged
prehistoric and ethnological museum. The Palazzo
di Conservatori, on the Capitol, contains many of
the best ancient statues. In the cloisters of the
Carthusian convent in the Thermes of Dio-
cletian are stored the antiquities brought to light
during the recent excavations. Others from the
excavations at Palerl are collected in the Tempio
di Papa Giulio, outside the Porta del Popolo.
The Villa Medici contains a good collection of
casts from ancient statues. The Lateran Palace
contains an unrivalled collection of inscriptions
and sculptures from the Catacombes, and a few
greek statues and mosaics. The Lateran is ex-
territorial, and the Museum is the property of
the popes.
The chief papal collections are contained in the
galleries attached to the Vatican, probably the
largest palace in the world. In addition to the
private gardens and apartments of the pope, the
Vatican Palace comprises immense reception-halls
with a series of chapels, libraries, picture-galleries, and
vast museums of sculptures, antiquities, and
inscriptions, which can here be only enumerated in
the list. The first collection, the Lateran, was built
by Sixtus IV., is covered with magnificent frescoes
of Michelangelo and the great Floren-
tine masters. The Capella Nicolina, built by
Nicola V., and the Pauline Chapel, built by Paul
III. in 1590, are also painted in fresco; the first by
Fra Angelico, and the second by Michelangelo.
Raphael's Stanze and Loggie are halls and salons
covered with inimitable frescoes executed by
Raphael, Perugino, Giulio Romano, and other
masters of their school. Beyond the Loggie is the
picture-gallery, containing the collection of the
Popes in Rome. The world-famous Vatican
Library, with its priceless MSS., its collections of early
printed books, of Christian antiquities, ancient
maps and jewellery, is contained in
two immense halls. The vast sculpture-galleries,
with their unrivalled collections, comprise the
Museo Chiaramonte, the Braccio Nuovo, and the
Museo Pio-Clemente, which includes the Cortile
di Belvedere, containing the Laocoon, the Apollo
Belvedere, and the so-called Antinous, perhaps the
most beautiful statue in the world. The inscrip-
tions are contained in the Galleria Lapidaria, the
Etruscan antiquities in the Museo Gregoriano,
below which is the Egyptian Museum.
The churches, said to be upwards of 300 in num-
er, are among the most conspicuous features of
modern Rome. Many of them are rather what we
should call mortuary or memorial churches, opened	only once a year on the festival of the saint
to whom they are dedicated. There are also the
churches of the great religious orders, twenty-eight
parish churches, and the titular churches of the
curia. The papal churches are the five
patriarchal churches, the seven piligrimage
churches, and the eight basilican churches. Others
are interesting either from their early date, their
historical associations, from the archaeologcal or
artistic treasures they contain, or from the frag-
ments of earlier structures which they enclose.
First in rank are the five patriarchal churches. S.
Giovanni in Laterano (see LATERAN), between the
Caelian and the Esquiline hills, ranks as the first
church in the Western world. It dates from the
time of Constantine. It was, till the building of
S. Peter's, the metropolitan cathedral of Rome and
of the western patriarchy. It retains its 5th-cen-
tury baptistry and the 13th-century cloisters, the
most beautiful in Rome. The Santa Scala, brought
by the Emperors Constantine and Helena from the
4th century, has been the object of veneration among
pilgrims. The church itself was burned down and
rebuilt in the 14th century, and has been repeatedly
altered and modernised. The adjoining palace
of the popes is now converted into a museum, chiefly
of Christian antiquities. S. Pietro (see St. Peter
in Vaticano), the largest church in the
world, was rebuilt in the 16th century from
the designs of Bramante, Michelangelo, and Ber-
nini. It was begun in 1506, and consecrated in
1626. It is in the form of a Latin cross, with a
vast central dome. The interior length is 675 feet,
the height of the nave 150 feet, and of the cross
which surmounts the dome 435 feet. S. Paolo
fuori le Mura, a vast 4th-century church, was
before the fire of 1823 the most interesting church in
Rome, but has been entirely altered and
modernised. It is of magnificent size. S. Lorenzo
fuori le Mura, occupying the site of a church founded by
Constantine, was rebuilt in 578, and remodelled in
the 13th century, but still retains the ancient marble
and granite columns. The Basilica Liberiana, on
the Esquiline, is commonly called S. Maria Mag-
core, being the largest of the eighty churches in
Rome dedicated to the Virgin Mary. It is one of
the oldest churches in Rome, the nave dating from
the 5th century.

These five patriarchal churches, together with
S. Croce and S. Sabazio, constitute the seven
ancient pilgrim churches. The five patriarchal
churches, together with S. Agnese, S. Croce, and
S. Clemente, are the eight basilican churches.
S. Agnese fuori le Mura was founded by Constantine,
and rebuilt in the 7th century. It contains many
early Christian inscriptions. S. Croce is a 5th-
century basilica, and is said to have been erected
by the Empress Helena. S. Clemente is the
most archaic church in Rome. The upper church
dates from the 12th century; the lower, which is entirely
underground, from the 4th; and the columns are
far older substractions dating from the imperial
and republic periods. In addition to the eight
basilican churches, others already mentioned con-
serve the remains of earlier buildings. S. Maria
in Cosmedin, one of the most interesting churches in
Rome, preserves ten columns of the Temple of
Ceres, out of which it was constructed, and
twenty ancient columns taken from other build-
ings. It also has a beautiful tesselated pavement
of ancient marbles. S. Maria degli Angeli and
S. Lazzaro were constructed out of the Thermes
de Diocletian, and S. Pietro in Carcere out of
the Mamertine prison. S. Giorgio in Velabro, a 4th-
century church, was rebuilt in the 7th century,
but preserves sixteen of the ancient columns. S.
Costanza, outside the Porta Pia, was erected by
Constantine, and contains interesting 4th-century
mosaics. The granite columns in S. Maria in
Araceli, on the Capitol, have been taken from
some earlier building. On the Caelian we have SS.
Giovanni e Paolo, founded in the 6th century and
rebuilt in the 14th; S. Stefano Rotondo, a 14th-
century church, containing the episcopal throne of
Gregory the Great; and the interesting church of
S. Gregorio, built in 575 on the site of his
father's house. On the Aventine are S. Balbina
and S. Sabina, both of the 6th century. On
the Esquiline are S. Ponenziana, a very ancient
church, with 4th-century mosaics, probably constructed in the time of Pope Innocent III. S. Prassede, another 5th-century church, with ancient granite columns and 9th-century mosaics; and S. Pietro in Vincoli, a 5th-century basilica, with twenty ancient Doric columns, and containing Michelangelo's statue of Moses, and the supposed tomb of St Peter, which was undoubtedly presented by Pope Leo I. to the Empress Eudoxia in 442. On the right bank of the Tiber are S. Crisogono, a 12th-century church, with ancient porphyry columns and a fine mosaic pavement; S. Maria in Trastevere, a 5th-century church; the Lateran, with two ancient columns, some fine mosaics, a splendid marble pavement, with numerous interesting early inscriptions in the portico; S. Cecilia has 9th-century mosaics; while the Piazza of S. Pietro in Montorio commands the finest view of Rome. S. Maria sopra Minerva, near the Pantheon, the chief Dominican church, is the only Gothic church in Rome. Among the vast modern churches are the Gesù, the gorgeous church of the Jesuits, containing the tomb of S. Ignatius Loyola; S. Carlo al Corso, now the fashionable church of Rome; S. Maria della Vallicella, commonly called Chiesa Nuova; and the Cappuccini, with its catacombs and Guido's picture of St Michael.

One of the greatest improvements which has been effected is the embankment of the Tiber, and the straightening and deepening of its channel. This has put a stop to the disastrous floods by which the lower parts of the city were formerly inundated. But the municipality being now practically bankrupt, the grandiose schemes for the further reconstruction of the city, and for making Rome a modern metropolis, can only be carried out by the Tiber, are for the present suspended.

In addition to the objects of interest which have been brieferly enumerated are the vast Catacombs (q.v.) extending underground for many miles, the Ghetto, the Sapienza, the Propaganda, and the Protestant cemetery with the tombs of Keats and Shelley. The best panoramic views of Rome are from the Tincio, the Villa Mattei, S. Pietro in Montorio, the Janiculum, the garden of the Priorato di Malta, and from outside the Porta S. Giovanni. Rome is now a fairly healthy city, except in winter, when the mouth of the Tiber is unfrozen, and the unceasing quantity, and the streets are well cleansed. No city excels Rome in its public fountains.

There are practically no manufactures in Rome. Hats, gloves, neckties, false pearls, and trinkets are made, and there are cabinet-makers, and a few foundries on a small scale, but compared with other great cities the absence of factory chimneys is very notable. There are printing-offices, but the Italian book-trade is centred at Milan. The chief industry is the manufacture of small mosaics, some of which are exported; carpet-makers are the most prosperous; and original or copies of the works of the great masters.

All the necessary life have to be imported from a distance, the Campagna which extends for many miles around Rome being uninhabitable on account of the malaria. It is an unenclosed and unhealthful country, and the temperature of the home, and cattle. Corn and wine are brought from Tuscania, and from the fertile Terra di Lavoro near Naples. The prosperity of the city depends on the expenditure of the courts of the Quirinal and the Vatican, of the army of functionaries in the public offices, of the clergy and of the tourists, who crowd the hotels during the winter months. The railways from all parts of Italy converge outside the city, which they enter near the Porta Maggiore on the Esquiline, and have a common terminus on the summit of the Quirinal close to the Baths of Diocletian. The omnibus service is good, and well-managed trams traverse several of the broad new streets.

See R. Burn, Rome and the Campagna (1770); J. H. Parker, Archæology of Rome (1852-80); T. Ilyer, City of Rome, its Vicinities and Monuments (2d ed. 1883); F. W. Bist, Rome; E. F. Agee, and R. Lanzi, Ancient Rome in the Light of Recent Discoveries (1888); with other works by Gell, Nich. Haz., Professor Middleton, &c., and those cited on p. 784.

ROMAN HISTORY.—Rome, the 'Mistress of the World,' the 'Eternal City,' gives name to a political empire which lasted twelve centuries, till its transfer to Byzantium, where it lasted eleven centuries more; also to a religious empire which since 42 A.D. has acquired spiritual sway over a yet larger dominion than its pagan predecessor, and which, in accord with imperial Germany, formed the twin-faction of the Holy Roman Empire, dissolved in 1806.

Colonised in the bronze age by Alban shepherds who migrated from their hills in fear of volcanic disturbance, Rome, according to her officially adopted legend, dates from 21st April 753 B.C., when Romulus, the first of her seven kings, settled on the Palatine mount. From his quadrilateral stronghold—Roma quadrata—he made conquest of the Capitoline and Quirinal. After his successor Numa, the Cahun was annexed by Tullus Hostilius and the Aventine by Ancus Mareius. To the hills, now five under Tarquinius Priscus the fifth king, were added the Esquiline and Viminal by Servius Tullius, who walled in the seven with a stone fortification. So that under her seventh and last king, Tarquinius Superbus, the City of the Seven Hills was already 'built for empire,' on marshy soil made habitable by drainage, and which was by board by the Tiber—a waterway so clearly the 'outlet of her supremacy,' as to warrant the derivation of 'Rome' and 'Romulus' from the teum or river.

Latin in population, with a Sabine infusion, Rome was divided into three tribes—the Ramnes, the Tubuluses, and the Luceres, and again into thirty curiae. The tribal division disappeared early; that into curiae lasted well into republican times. Out of the curiae, originating in common religious observances, grew the populus Romanus, including all the Latin and Romans. Its king (rex) was not always hereditary either in his regal or his religious capacity, nor merely elective. When a king died, his successor was chosen by the heads (patres) of families (gentes). These patres—the guardians of religious observance, of popular right, of state interests—and power to choose a pro-visional king (inter-rex), who, with the patres for assessors, decided on the new king, who was then proposed to the curiae in assembly (comitia curiata) and, if approved, confirmed by the patres.

The king had now absolute authority, civil, religious, and military, subject only to the councillors—the senate—having the above indicated powers, always subject to the king, who consulted them at pleasure, and filled up vacancies. In solemn assembly the Romans met in the Forum under the king or inter-rex, who put questions to the senate, who were curator of the city, turn, its vote being determined by the majority within itself, and the preponderance of these votes deciding the result.

Romulus, Numa, Tullus Hostilius, and Ancus Mareius were the first and third Latin, the second and fourth Sabine, the little king's second name; the legendary names; the warrior chief Romulus typified by his Roma quadrata and Comitium or place of assembly in the Forum; the priestly Numa by his Temple of Vesta and his Regia close to it; the statesman
Tullus Hostilius by his Senate House (Curia Hostilia); and the administrator Ancus Marcus by his state-prison, his bridge across the Tiber, his fortification of the Janiculum, and his founding of the seaport Ostia. In Tarquinius Priscus (616–578 B.C.) we have an Etruscan and less shadowy hero. Tarquin, son of the Senate, buiten from conquered Latin states, and laying out the Circus Maximus for the entertainment of the people. Servius Tullius, on Tarquin's initiative, distributed all freeholders (for military purposes primarily) into tribes, classes, and centuries. Until his death, Tullius, who lived to the age of one hundred in front were composed of the wealthier citizens as better able to equip themselves for attack; behind them came the centuries of the second and third classes, poorer and less fully appointed—the three forming the heavy-armed infantry; while centuries of the fourth and fifth classes, poorer still and correspondingly equipped, held the rear. The full strength of the freeholders was divided into two equal parts—the seniores and the juniors, the latter engaged in agriculture. A member of the centuriata consisted of 85 centuries or 8300 men—i.e. of two legions, each about 4200 strong, auxiliary to which were the sappers and trumpeters. Finally, the six centuries of cavalry were supplemented, from the wealthiest citizens, by twelve more. For the service of the army were again divided from him into four regions, corresponding to his four tribes, the Suburan, the Palatine, the Esquiline, and the Colline. These tribes included freeholders outside the gates, also entitled to meet and vote with the centuries at their comitia (comitia centuriata). Under her seventh and last king Rome became formidable throughout Central Italy, and owed to him the Temple of Jupiter Capitolinus, and the Cloaca Maxima—the drainage system tapping the hills around the Forum and carrying the waste into the Tiber. But Tarquin's rule was so masterful as to drive the people revolt, the last devastation being his son's outrage on the noble Lucretia. When engaged at a siege near the coast he was dethroned; he and his race were exiled in perpetuity, and regal government replaced by the Republican. To reinstate him were defeated, and he died at Cumae.

The Republic.—The regal check on them withdrawn, the patricians made their power so felt by the plebeians as to start a conflict between them lasting two hundred years. The king was now military capacity two consuls, elected annually, and from the patrician order. The plebeians, born of citizens as they were, retained their votes by classes at the comitia curiata and by centuries at the comitia centuriata, but many of them were attached as clients to patricians who commanded their votes and all of them were excluded from the higher offices of state. Unable to elect one of themselves consul, the plebeians had not even the power to carry the patrician candidate they favoured, being in a minority in the comitia centuriata, and, again, in the more immediate and decisive assembly, the comitia curiata. The absolute authority wielded by the consuls they felt to be still more oppressive when, in state crises, it was merged in a dictator; so their first attempt to safeguard their liberties and rights to elective control of the consul was an attack. The first advantage they gained was the 'right of appeal,' by which no magistrate (the dictator excepted) could subject a Roman citizen to capital punishment unless with approval of the comitia centuriata. Power to exact such rigours from the military capacity, raising, as soldiers, to serve unless their demands were conceded. The secession of their legions to the Mons Sacer, on the

Anio three miles off, secured them annually elected magistrates of their own, tribuni plebis, with power to protect them against the consuls. From two the tribunes were increased to five, and by 449 B.C. to ten. In a sense a magistrate, the tribune was a check on authority, and his power developed gradually till the tribunate, formidable at the close of the Republic, became still more so under the empire. By the Publilian law (471 B.C.) the assemblies convened by the tribune (comitia plebis) were made legal; not yet their decisions (plebiscita). At these the voting was by tribes, each by its own presiding officer. The effect of the tribunes was to add as many as possible to become member of a tribe it was necessary to be a freeholder, and so the tribunes, to multiply freeholders, agitated to secure for the plebeians their share of the agri publici or state-land. Of these partially succeeded this, they won another advantage from the ever-resisting patricians—the appointment for one year of a commission of ten patricians (decemviri) to make public a code of law binding on patrician equally with plebeian, the Twelve Tables—substituted written and published law, in place of the unwritten code, confined to the patrician few, was always interpreted in their interests. An attempt to reappoint, possibly to perpetuate, the decemvirs caused another secession; the consuls were again expelled from the state. The ground of their comitia, increased by accessions to the plebeian order from without, the tribunes extended the recognition of the plebiscita as legally binding on patricians. The comitia, now become comitia tributa, could henceforth carry reforms which, if sanctioned by the patres, had the validity of state-law. Another concession gained was intermarriage between plebeian and patrician, and thereafter the consulate—still the patrician stronghold—was attacked. The two consuls were replaced by six military tribunes drawn from either order. Of these partially succeeded this, the plebeians generally had the majority until, obstacles and delays notwithstanding, the Licinian and Sextian laws were passed (367) replacing the consular tribunes by consuls, two in number, of whom one at least should come from the plebeian college and at least one from another college from two to ten functionaries, of whom plebeians were to constitute half; relieving the poorer plebeians from debt; and promoting their interests by advantageous reforms in the ownership and cultivation of land. Patrician monopolies shrink rapidly. In 236 the dictatorship, in 350 the censorship, in 337 the pretorship, and in 300 the colleges of pontiffs and augurs were thrown open to plebeians. The potestas auctoritas, or control by patricians of the decrees (plebiscita) of the people in assembly, became a dead letter; and the two hundred years' conflict issues in the recognised validity of all measures carried in the comitia tributa—a conflict memorable not only for the ability displayed by either order, but for the respect for law observed equally by both. For her first fifty years of republican life Rome expanded little. Nearest her were the Latins, the Volscians to the south-east, the Equians to the east, and the Hernicans between the two last. Allying herself with the Latins and Hernicans, she held the south, she kept the city, she riveted her hold on south Etruria, and her policy became triumphantly aggressive in the sixty years between 449 and 390. Having razed the south Etruscan stronghold, Veii, she pushed northward to the Ciminnie forest, whence she drew down on her the Celtic conquerors of north Etruria, who, defeated, scattered in the north, the city, all the capital. Recovering rapidly from this disaster, she riveted her hold on south Etruria, gradually subjugated her old enemies and
Following up this advantage, she transferred the war to Africa, and was at first so successful as to recall a considerable part of her forces. But her consul Quinctius, whom she left behind, was worsted and almost completely defeated by Hamilcar at the battle of Ticinus, in 247 B.C. The Carthaginian general, having thus gained a temporary advantage, returned to Africa, where he speedily made preparations for another invasion. In 241 B.C. he again crossed the narrow strait, and captured the island of Sicily, which he had been so fortunate as to obtain from the Romans. But he was not long in the island before he was advised of the death of his master, and the invasion of Italy by his brother Hannibal. On this information, he immediately returned to Africa, and concentrated his forces, consisting of an army of 30,000 foot and 5000 horse, and an fleet of 250 galleys, under the command of his son Hasdrubal, with the view of extirpating Rome once more.
of Italy, to reinforce Hannibal in the south. But he was beaten and killed on the Metaurus by Nero, who, turning southwards, marched up to Hannibal's camp and threw Hasdrubal's head into it. The war in Italy was virtually at an end. Hannibal's attempt on Rome had failed. Meanwhile young Publius Scipio, having driven the Carthaginians from Spain, returned to the city with the proposal to descend on Carthage herself. The senate, not without hesitation, acceded. The success in Africa compelled Hannibal to leave his vantage ground in Southern Italy and come to the aid of his hard-pressed compatriots. The great battle at Zama left Scipio the victor, Hannibal a fugitive, and Carthage snaring for peace. Her request was granted, and she retained her territory, but bound herself to undertake no wars outside Africa and (without the consent of Rome) no wars inside. She surrendered nearly all her navy and had to pay an indemnity of 10,000 talents in fifty years. Rome was now (202 B.C.) mistress of the Mediterranean, but she had to consolidate her acquisition. Sicily, easily ruled under a pretor, became her granary and the provision store for her legions. Spain, however, required pretors invested with consular power and a permanent garrison of four legions to keep the enemy's foot soldiers from menacing it. This lasted till the fall of Numantia after a memorable resistance; and not before Scipio Africanus the younger took it in hand could the country really be called pacified and its rich resources made available. Meanwhile Rome had a secret dread of the resuscitation of Carthage, and she had prepared every pretext for renewing war with her and razing her to the ground. That came in 151 when Carthage, goaded by Masinissa's forays, broke her treaty obligations to punish him. In 149 Rome had sleig to her, and by 146 she was stamped out of the role of great cities. Her territory was doubled. It was protected by Masinissa's three sons, who ruled Numidia. In Italy herself the cities that had declared for Hannibal were severely punished. In the north the Celts forfeited their separate political existence. In the south Roman settlers occupied confiscated lands—nearly everywhere but in Apulia and Lucania; and even the Latins soon felt the preponderance of the Roman element, which tended more and more to assert itself.

Fifty years after she became mistress of the world Rome was the mightiest state in the east, first by conquering Philip of Macedon, who had been the ally of Hannibal, and whose ambition to dominate the Aegean drew Rome into the second Macedonian war (200), which ended in Philip's defeat at Cynoscephalae and the reduction of Macedon to a minor power. Next came the 'liberation of Greece,' which, with the alliance that followed, enabled Rome to proceed against Antiochus, king of Syria, who in 197-196 had overrun Asia Minor and penetrated into Thrace. As she had made her entrance into Asia Minor at a decisive defeat at Magnesia in Asia Minor, and fell back behind the Halys and Taurus range, to the west of which all the kingdoms and communities were now under Rome's protection. Western Greece, however, began to give trouble, and the Greek states till the whole peninsula was subdued to Rome. Steadily strengthening her hold on Asia Minor, Rome further assumed the guardianship of the king of Syria; while in Egypt, which in 168 had acknowledged her suzerainty, she restored a protector of hers to the throne, at the same time, true to her policy, dividing and weakening his power. From Syria to Spain the Mediterranean was now a Roman lake, but her authority was better established in the west than in the east. In the Orient her Novial government was fairly established; not so in the latter, which, besides its more elastic frontier, possessed a civilisation in some respects superior to her own.

With the establishment of her supremacy without bloodshed Rome was already beset by a new menace. The plebeian (mobales) combined with the old patrician families (optimates) to exclude all but themselves from high office or the senate. The constitution had become an oligarchy in which the comitia, nominally supreme in electing magistrates and passing laws, were practically supersedes. The prestige of having saved Rome from Hannibal and raised her to undisputed empire belonged to the aristocratic senate, while the graver disasters (at Trasimene and Cannae) were due to the people's favourites. But that prestige was getting gradually impaired by economic failure at home and confusion abroad, and the people were awakening to a sense of the power the senate had taken from them. The small holders, particularly in Etruria and South Italy, burdened with military service and passing laws, were practically supersedes. became urgent. The Italian communities—the allies of Rome—had long felt their burdens increase as their privileges waned, and they demanded their share of the conquests they had helped to achieve. Promises of relief and expectation of securing the Italian provinces had brought Drusus in crowds to the capital, to be driven back again by an exclusive senate and people. The tribune Drusus strove to bring about fiscal reform and the redress of the Italians, but though he carried his laws he could not make them valid, and finally he was assassinated. The private grievances and resentments which the murder of Drusus roused the irritated Italians to rebellion (79–80) in the central highlands and the south especially. The Social War began, the insurgents aiming at the creation of a new Italian state governed on the lines of the Roman constitution. To suppress them the two consuls of the year, each with five legates, including Marius and his future rival Sulla, headed the legions, but were disastrously beaten. In the north, however, Marius and Sulla, and in Campania the consul Caesar, were partially victorious, but so partially that the reform had to be left to the Italians could obtain the franchise merely for the asking. The war at length died out by the absorption of the insurgents into the Roman citizenship; but the internal troubles continued. The new citizens enlarged their political claims, the secessions increased by personal feuds, economic distress prevailed among all, and a war with Mithridates threw Marius and Sulla into rivalry as to which should command the expeditionary force. The action of the tribune Fulvius in dealing with this complicated crisis intensified it the more. He was sent to the East on a Mithridatic campaign, to allow the new citizens to vote in all, not in a restricted, number of tribes, to confine the freedmen to the four urban tribes no longer, to unseat any senator more than 2000 denari in debt, to recall from exile those suspected of complicity with the Italian insurgents. Every one of these proposals, bitterly contested, would yet have become law but for the consul Sulla, who, heading in Campania the legions assigned him in the Social War, marched on Rome—the first consul who ever in his own city. Marius and Sulla left him free to impose arbitrary measures, among them that by which the sanction of the senate was required before any bill could be entertained by the comitia; and, having seen the consular elections safely through, he set out against Mithridates (78).

In his absence Cinna attempted as consul to carry the reforms of Sulpicius, but was driven from Rome amid the massacre of the new citizens in voting assembly. He in turn rallied round him the legions in Campania, and joined by the veteran Marius, who, returned from Africa, he entered Rome and was recognised as consul, as was Marius himself (for the seventh time). After a brutally vindictive massacre Marius died (78), and Cinna remained supreme, securing the consulsight to himself and a confereate, and getting the newly-enfranchised tribes enrolled. In 74 he died, and next year Sulla, having concluded a peace with Mithridates and left Asia tranquil, landed at Brundisium with a powerful army, including many of the nobles who had fled from Cinna. Resistance, nowhere formidable, he quickly overthrew. The triumphs of Sulla followed. He received Mithridates triumphant in North Italy and to annihilate the remnants of the Marian party just outside the city. But he failed to use his power, absolute as it was, for the abatement of long-standing evils and the prevention of coming disasters. Triumphant everywhere, he instituted a reign of terror—slaying, proscribing, and confiscating through revenge of suspicion. For nine years his rule as dictator, in spite of much salutary administration, was marred by a remorseless partisanship which left the future to take care of itself—creating in the sons and heirs of the proscribed and dispossessed the handy tools of agitation, justified as this increasing by the ruined agriculture, by the multiplying of latifundia with their necessary evictions, and by the rapid disappearance from near all Italy of her substantial freeholders. Life and property, already widely forfeited at his bidding, were still further diminished for the sake of need, and the combination of the formidable rising of Spartacus, who held out for two years (73–71). Still fortifying the senate, Sulla left the tribunes with no power of interdict save in protecting individual plebeians, and he excluded them from ever holding high office; he took from the equestrians the control of the courts, giving it back to the senate, to which he also restored its exclusive rights in the colleges of pontiffs and augurs. He extended the application of the criminal law—a wise measure; but he did more than any Roman before him to facilitate the rise to supremacy of a body of noble leaders, but of mere vince or leader of a provincial army. He forged in fact the weapon by which his system fell (70).

In Spain Cneius Pompey, one of Sulla's favorites, held a commission from the senate to crush the Marian governor Sertorius, who had defeated successive consuls and equestrians in his province; the submission of the natives following the murder of Sertorius he returned to Rome, and found the opposition to Sulla looking out for a leader to effect a change of government. His ambition to have a triumph, to be made consul for next year (70), and by conquests to obtain command of the army, was gratified for the sake of his name and influence. He was elected consul with Crassus, the victor over Spartacus, their troops being just outside the gates, and on the triumph and ovation granted to the two generals ensued Pompey's fulfillment of the bargain—the reinstatement of the tribunes in their authority and of the equestrians in the courts, and the weeding out from the senate of Sulla's notorious tools. The example set by Sulla was improved upon, and henceforth the republican constitution was the shield of the strongest leader. Pompey's next move was to obtain command abroad, and after some delay this was found in a mission to clear the Mediterranean of pirates. For this formidable undertaking the tribune Gabinius secured him large powers, tenable for three years, including motion of public works and entertainments, to live and register in the Mediterranean provinces for fifty miles inland. These, backed by a splendid fleet and army, were yet further enhanced by the tribute Manlius, who got Pompey entrusted with the campaign against Mithridates and with the charge of Roman interests in the east. The wiser senators gave ominous warning against these measures, but were powerless against tribunes and people, seconded by equestrians, who as the commercial class drew much of their wealth from Asia. So Pompey set out in 67. Meanwhile Cicero, as consul, extorted from the tribune Pansa an order from his own great contemporary, Cinna, who was also the nephew of Marius and son-in-law of Cinna, and whose consummate ability, shown in the revindication of the tribunate and the carrying of the measures in support of Pompey, had full scope now that Pompey's back was turned. He declared the peace treaties, and fingering the injured names of Marius, Cinna, and Sertorius, pleading for the children of the proscribed, and bringing Sulla's headsemen to justice.

Rising in popular favour by his efforts to enfranchise the Transpadane Latins and his munificent promises of works and entertainments, he spared no means, constitutional or the
reverse, to put himself on even terms with Pompey before that magnate’s return. Crassus, the millionaire, he found a tractable auxiliary, in concert with whom he was rapidly gaining powers hardly inferior to Pompey’s, when the Catilinarian conspiracy came out. Pompey, Cæsar, and Cæsar’s friends, as consuls, involved Cæsar in the ill-will in which the middle classes held popular adventurers. Pompey had now returned to importune the senate for the ratification of his measures in Asia and the bestowal of land on his legions. His demands were met with determined opposition, till Cæsar, pistols as his friend, formed with him and Crassus the coalition—the first, if irregular, triumvirate—of which Pompey was the head, Cæsar engaging to see Pompey satisfied, and Pompey in return promising Cæsar’s candidature for the consulship. Cicero strove to undo a coalition he knew to be fatal to his ideal of a conservative republic, but in vain; he saw the senate weakened by a quarrel with the equestrians and its authority impugned by the friends of Catiline, who armagged him for having rejected the senate’s approval, violated the law in putting to death the conspirator’s lieutenants. The triumvirate in 59 fulfilled its compact. Cæsar obtained the consulsip and the satisfaction of Pompey’s demands, conciliated the equestrians at the expense of the senate, and carrying on the bills of days and the tribunals as a reward his faithful friends. But his crowning success was his obtaining for five years the military command of Cisalpine Gaul, Illyricum, and later of Transalpine Gaul, from which he could scan every political move in Italy. The next year (58) Cæsus, the tribune, proceeded against Cicero, who, thrown over by Pompey and with Cæsar out of reach, fled from Rome and was outlawed—to be recalled (57), and his outlawry annulled by senate and people, in the reaction induced by Cæsar’s misdeeds. Cicero, to fortify the constitution, renewed his efforts, only to fail and retire from public life. The triumvirs tightened their alliance. Cæsar secured his command for five years more; Pompey and Crassus were elected consuls, and Pompey received as province the two Spain’s, with Africa, and one year the province of Asia, at the mercy of all three, not, however, for long. Cæsar was defeated and killed by the Parthians (53), and Pompey was slowly but surely drawn into antagonism with Cæsar. Rome, in the absence of Cæsar, was harassed by deadly turmoil till the senate in despair induced Pompey to remain in Italy, electing him sole consul (52), giving him, with fresh legions, five years’ more command, and, in fact, pitting him as its champion against Cæsar. It tried to reduce Cæsar to impotence, either by keeping him at his post, and so baulking his candidature for the consulship, which required his presence in the capital, or, by terminating his command at its legal expiry, to detach him from his troops and make him pursue his candidature in Rome as a private citizen. Negotiations being unsuccessful, the senate only left the latter more unpromising; and with well-inspired audacity he crossed the Rubicon (49) and advanced on the city. Unprepared for such a move, Pompey and most of the senatorial party, including the consuls and many nobles, withdrew to Greece, leaving Cæsar to enter Rome in triumph. The mighty duel between the two chiefs had begun. After a brief pause Cæsar hurried to Spain, and, victorious over the powerful armies of Pompey’s legates, returned to Rome, where, appointed (48) dictator in his absence, he almost immediately renounced the post, and as consul for 48 crossed over into Greece and dealt Pompey a crushing blow at Pharsalus. The Pompeian cause struggled on till 45, when it collapsed at Munda, and Cæsar was made by the senate dictator for life. Unlike Sulla, he used his power with a clemency, a statesman-like wisdom, and a patriotism that made men almost forgive, if not forget, how he came by it. The roll of his salutary reforms and innovations included Cæsar, Cicero’s, as consul, involved Cæsar in the ill-will in which the middle classes held popular adventurers.

The Empire.—Augustus began (28–27 B.C.) by a restoration of the republic, with himself as princeps, the republican constitution being retained, while the principal head of the state and the principal source of authority which had been in the hands of Caesar was assigned to a princeps. This was done by a decree of the Senate, which gave him the title of Augustus, in token of supreme dignity, the cognomen 'Augustus,' and also the procureuscire imperium, which far exceeded the old proconsular command in width of area and length of tenure, the provinces being governed by legates appointed by him. At the head of army and navy he was commander-in-chief, raising or dissolving both, and declaring or concluding war at pleasure. His imperium, contrary to precedent, he was allowed to retain within the proconsular imperium, and he consigned him there the power wielded by a proconsul in his province. Augustus refrained from exercising this in Rome, but as tribune of the people he controlled the entire administrative machine, so that, what with proconsular command and the tribunicia
potestas, he possessed powers which made all others of them. Henceforth, he was the head of religion as pontifex maximus, and from time to time he had privileges and exemptions decreed by the senate. Anxious as he was to retain the outward show of republican institutions, they declined under the weight of his personal influence. Vitellius, the last Flavian to attempt to enshrine the name of the Flavians in senatorial immortality, was succeeded by Otho, whose name became a synonym for the enmity of the pretorians, who killed him in the interests of Otho (69), now proclaimed emperor. But the legions on the German frontier preferred their own general, Vespasian (69). Otho, defeated at the head of his pretorians, committed suicide. He had been born to a humble family and from his564 youth had been destined to be murdered after being disavowed by the army in Syria, who proclaimed their commander, Vespasian. With him began the Flavian (69-96), strong and beneficent emperors, save one. Vespasian (96-79) disinherited the divine attributes of the Flavian gens, and established the claim of his predecessor, and not only returned to the simpler life and more modest court of early imperial days, but tried to resuscitate the authority of the senate, and even ostentatiously to keep himself within the law and to promote the welfare of the people.Titus (79-81) improved on this sound policy, while providing public baths and the amusements of the Colosseum; but his brother Domitian (81-96) became infamous for profligacy and cruelty, popular only with the worst of his pretorians. Nerva (96-98) was restoring the best traditions of the Augustan age; Trajan (98-117) was not murdered by the pretorians, impatient of his austerities—not, however, before he had adopted as son and successor Trajan (98-117), commanding on the Rhine. The assumption of empire by a born provincial illustrates the gradual weakening of Rome's connection with her rulers, whose semi-legislative government became really the military headquarters for the time being. He and the following three emperors gave Rome a century of beneficent rule—the happiest hundred years yet known to her. Living like a plain soldier, he conscripted the senate house for his headquarters and made official his corresponding advances in civilization and prosperity. With the establishment of the imperial system the fortunes of Rome are reflected in those of her emperors, to narrate which would be to repeat the biographies given elsewhere. Henceforth we have but to deal with epoch-making events. Tiberius (14-37 A.D.) had little of his predecessor's esteem, genuine or assumed, for republican institutions. The senate became more of an imperial tool, all power more and more embodied in the princeps. The simple noble of life affected by Augustus was replaced by his, a career composed of more and more palatial residences, in the bodyguards, the courtiers, the aulic etiquette subsequently carried to unheard-of lengths. The population of Rome, from the highest to the humblest, deteriorated—a wealthy, indolent, luxurious upper class maintaining mobs of dependents, below whom was the proletariat, which the emperor from time to time provisioned and armed. Secure against public opinion, Tiberius relied on the military arm, and in Rome herself had his proctorian guard, some 6000 strong, within reach. These troops acquired a power which overshadowed all others; the emperor became more and more dependent on them. Caligula (37-41) did much to show with what depravity the imperial system was compatible, and in the succeeding reigns of Claudius (41-54) and of Nero (54-68) could generate had further illustration. The former, noble emperor by the pretorians in defiance of the senate, was the creature of profligate and scheming wits, the second of whom poisoned him; the latter perpetrated every crime or excess within his power, till suicide, the ultimate ignominy, fell on the joy of Romans, provincials, and of the whole empire itself. Like his two predecessors he had first been hailed by the soldiers as emperor, and thereafter invested with power by the senate; but with him the succession from Augustus expired; and whom to replace him by was the question. Galba (69), with the nomination of some, unlike those of the ennui of the pretorians, who killed him in the interests of Otho (69), now proclaimed emperor. But the legions on the German frontier preferred their own general, Vespasian (69). Otho, defeated at the head of his pretorians, committed suicide. He had been born to a humble family and from his564 youth had been destined to be murdered after being disavowed by the army in Syria, who proclaimed their commander, Vespasian. With him began the Flavian (69-96), strong and beneficent emperors, save one. Vespasian (96-79) disinherited the divine attributes of the Flavian gens, and established the claim of his predecessor, and not only returned to the simpler life and more modest court of early imperial days, but tried to resuscitate the authority of the senate, and even ostentatiously to keep himself within the law and to promote the welfare of the people. Titus (79-81) improved on this sound policy, while providing public baths and the amusements of the Colosseum; but his brother Domitian (81-96) became infamous for profligacy and cruelty, popular only with the worst of his pretorians. Nerva (96-98) was restoring the best traditions of the Augustan age; Trajan (98-117) was not murdered by the pretorians, impatient of his austerities—not, however, before he had adopted as son and successor Trajan (98-117), commanding on the Rhine. The assumption of empire by a born provincial illustrates the gradual weakening of Rome's connection with her rulers, whose semi-legislative government became really the military headquarters for the time being. He and the following three emperors gave Rome a century of beneficent rule—the happiest hundred years yet known to her. Living like a plain soldier, he conscripted the senate house for his headquarters and made official his corresponding advances in civilization and prosperity. With the establishment of the imperial system the fortunes of Rome are reflected in those of her emperors, to narrate which would be to repeat the biographies given elsewhere. Henceforth we have but to deal with epoch-making events. Tiberius (14-37 A.D.) had little of his predecessor's esteem, genuine or assumed, for republican institutions. The senate became more of an imperial tool, all power more and more embodied in the princeps. The simple noble of life affected by Augustus was replaced by his, a career composed of more and more palatial residences, in the bodyguards, the courtiers, the aulic etiquette subsequently carried to unheard-of lengths. The population of Rome, from the highest to the humblest, deteriorated—a wealthy, indolent, luxurious upper class maintaining mobs of dependents, below whom was the proletariat, which the emperor from time to time provisioned and armed. Secure against public opinion, Tiberius relied on the military arm, and in Rome herself had his proctorian guard, some 6000 strong, within reach. These troops acquired a power which overshadowed all others; the emperor became more and more dependent on them. Caligula (37-41) did much to show with what depravity the imperial system was compatible, and in the succeeding reigns of Claudius (41-54) and of Nero (54-68) could generate had further illustration. The former, noble emperor by the pretorians in defiance of the senate, was the creature of profligate and scheming wits, the second of whom poisoned him; the latter perpetrated every crime or excess within his power, till suicide, the ultimate ignominy, fell on the joy of Romans, provincials, and of the whole empire itself. Like his two predecessors he had first been hailed by the soldiers as emperor, and thereafter invested with power by the senate; but with him the succession from Augustus expired; and whom
paid by Rome, gave the rights of citizenship to the former, thus equalising all and unifying the empire. His brutal personality has no further interest for us; the more than that of his fifteen successors, nearly all of whom came by death, generally, at the hands of the soldiers who had set them up. For them the dreary *Augustan History*, or its vivid condensation by Gibbon, must suffice, with our own articles on Heligoland, Severus, the three Gordians, Galba, and Gallienus. They left the Roman empire week by week, everywhere exposed to the Franks on the Rhine and the Goths on the Danube. The former ravaged Gaul and Spain, the latter Asia Minor and Greece, while the Persians, relieved of the Parthian yoke, had again become a formidable power in the east. In Rome and throughout Italy anarchy and distress prevailed till a temporary revival was brought about by the *Illyrian emperors*—Claudius (268–270) driving back the Goths, and the yet abler Aurelianus (270–275), by his victories over Goths and Germans and his successes in the east and west, restoring the lustre of the Roman arms, and, for a brief space, the unity of the empire.

Dioecletian (284–305), also an Illyrian, the next great name on the imperial roll, introduced a system of partition and administration akin and aggregate from without. He assumed that his first and greatest colleague he could find to share with him the government of the empire. This was Maximian, who, like himself, took the title of Augustus. He further reinforced this dual control by associating with him Gallic and Oriental able generals, like Maximian, whom he proclaimed as *Caesares*, below the two *Augusti* in rank, but with the right of succession to these. He himself had Thrace, Egypt, and Asia under him; to Maximian he gave Italy and Africa, to Constantius Gaul, Spain, and Britain. Thus internal sedition was suppressed within the empire, and, this distraction removed, the frontier fortifications could be perfected. The Rhine, the Danube, and the Persian boundary were garrisoned at frequent intervals and the barbarians kept in check, while all temptation of the soldiers to rebellion was overawed by the repressive measures at the command of the four rulers acting in concert. Rome now ceased to be the one capital. If she remained a capital, it was as the seat of a nominal senate and an inveterate court of last resort. He set up his headquarters, Dioecletian at Nicomedia, Maximian at Milan, Constantius at Treves, Galerius at Sirmium. This was a momentous departure from the tradition by which the emperors had claimed to be but the supreme magistrates of the city and the chiefs of her armies. Rome indeed was less imperial than any town in which the emperor chose to live. The policy of keeping the soldiery estranged from the emperor's presence took the form of increased dignity in his demeanour and model of life. He was the most experienced, by Aurelian reaching extravagant lengths in Dioecletian. He reorganised the services, civil and military, under new titles, which came to be more valued than the republican consuls or senator, and typified the completely autocratic power he assumed. He was a dispensing of death, wealth, and power effectively: but after twenty-one years, and in breaking health, he abdicated publicly the power he felt incapable of wielding. His masterful personality no longer felt, rupture between *Caesares* and *Augusti* ended in civil wars, the theme of which was the Cesar Constantius Constantine, who had himself become Caesar of the army in Britain, overcame all rivalry, and in 323 ruled the empire single-handed. Christianity, since its rise under Augustus and its spread under Tiberius and the later emperors, had triumphed over the last attempt under Dioecletian to crush it by persecution, and the politic Constantine, adopting it as his own religion, made it also the state's. To the toting imperial fabric it brought new strength, armed with which he proceeded to develop Dioecletian's policy of religion, Constantine, commanding by its position the Greek and Asiatic worlds. Remodelling Rome's traditional institutions, he made a new senate, with a large infusion of Greeks, all of his own choosing: he instituted a new *prefectus urbi*, and founded in the 'Rome on the Bosporus', an absolute monarchy. Reducing the number of soldiers under each general, he weakened the army's power to revolt by dispersing it among small garrisons in the cities, the other for the frontiers. The same subdividing process he carried into the provinces, splitting them up into districts, which again he rearranged into thirteen larger ones, subject to four prefects, responsible in their turn to the emperor. Multiplying officials who owed everything to him, he made them the nucleus of a new nobility, to supersede the old, and to find their interest in perpetuating his power. These sagacious measures, coupled with the prestige of the new religion, reinforced the army greatly; the taxation seemed to prove it an easier path to happiness. The costly court and the highly paid officials drained the treasury, which had to be replenished by extortions from the people, who met them from the proceeds of the land they tilled. The forays of the barbarians, increasing in number and range, steadily reduced the means of these small holders, who thus, except in profound peace, could not satisfy the tax-gatherers. Farms disappeared, not to be replaced, and unproductive waste-lands encroached more and more within the frontier. The death of Constantine in 337, and the civil war among the rival Caesars, till Constantine's only surviving son, Constantius II. (331–361), succeeded in uniting the empire under the same house. Not without misgiving he made a 'Cesar' of his cousin Julian and entrusted him with Gaul, where Julian's success was such as to rouse his jealousy. Constantius accordingly commanded his cousin's legions to start for Persia; but instead of complying they proclaimed Julian emperor and Augustus. Conclusions died soon after, and an inevitable conflict was set on foot. Julian has the interests us more by his defence of the Rhine frontier and his Persian campaign than by his 'apostasy' from Christianity. He succeeded in staying off the barbarian inroads on the western provinces; but his diversion in favour of the 'cruel outworn' did not survive his last encounter on the Tigris, where he was killed. Jovian, who succeeded him on the battlefield, outlived him a few months, and Valentinian I. (364–375), the next emperor, at the instance of the army which had proclaimed him, left as his colleague his brother Valens, whom he made emperor of the east. For ten years the dual government prevailed, and the barbarians were kept in check at the Rhine and Danube, but his death found Valens unequal to his post. The Goths, gored by the Huns in the year, had the opportunity of putting to rout a majority of their imperial neighbours, but were so harshly treated that they turned on them and killed Valens in battle (378). They threatened Constantine, but the next emperor, Theodosins (379–395), made no attempt to develop Dioecletian's policy of religion, 368; so that he was able to keep on the throne his colleague of the west, the feeble Gratian. That emperor was murdered (383) by Maxiinus, whom Theodosins recognised as Caesar and left in command of Gaul, Spain, and Britain, till Maximus (386), worsted by Theodosins in his attempt on Italy and
Henry IV., the short rule of Rienzi (q.v.), the sack in 1527 by the Constable de Bourbon (q.v.), the Napoléon of 1804 and the Dutch and later the re-establishment in 1870 of Rome as capital of Italy. The history of the Eastern Empire is given at BYZANTINE EMPIRE.

Rome Medieval: Gregorovius's Geschichte der Stadt (Eng. trans. 1895); Von Reumont; Hanne's History of the Popes; Siamoni, Abbatita L'Italia nel Medio Evo (1891); and the church histories of Barozini, Robertson, and Milman; Milman; and Dyce, History of the City of Rome (2d ed. 1883); Graf, Roma nella Memoria del Medio Evo (1882–83); Lucchini, Pagan and Christian Rome (1893); and Burn, Ancient Rome and its Neighbourhood (1895); and see Cerrioli's Bibliografia di Roma (1893) and Villari's 'Rome Medieval and Modern' in the Encyclopaedia Britannica. Becker's Gallus, Lockhart's Valerius, Graham's Neron, Westbury's Acte, and Wiseman's Fabiola are works of fiction dealing learnedly and affectionately with the history and life.

RELIGION.—The religion of ancient Rome was in practice and theory almost always a polytheistic one. So accounts for the ease with which in later times two religions became blended. Rome's earliest occupants, the Latins and the Sabines, had, like the Greeks themselves, a Pelagie progeniture, and the greater number of their divinities were ultimately descended, through the Latin and Sabine, from Pelagie originals. The Etruscan infusion into Roman nationality affected religion mainly on its external side, that of ceremonial. Among these Italian races—Latin, Sabine, Etruscan—religion took an Italian development, redolent of their racial and geographical surroundings, and when compared with the Greeks, lack of creative power was one; hence we miss in the Roman divine world that wealth of legend which makes the Greek so picturesque, while from the same cause the Roman divinities betray fewer of the failings by which those of Greece often sink to the human level. The Roman genius, with its practical and objective turn, determined the more observant spirit of its religions worship, which in its minute attention to detail, both in word and act, implied a graver, more reverential notion of deity. Sprung from shepherd stock, attuned to the rhythm of pastoral, agrarian, patriarchal type, the early Romans strike a rural and domestic note in their religion, worshipping especially the gods of nature, of field and forest, the bounteous protectors of flocks, or donors of harvests, like Fauns, Vertumnus, Saturn, Ops, and the like. In the family, the social unit, gods of the family (Lares and Penates). This worship long retained in Rome the rural and household traits of its original inspiration, and far down in the history of the empire we find numerous festivities antique as to observance and yearly as to recurrence, especially at the festivals of Bacchus and Silvanus, such like. Side by side with her agricultural, pastoral, and household divinities Rome from the earliest times continued to worship the deities who protected her civic life—state-deities, like her...
founder and maintainer, Jupiter. With her political growth these came more and more to the front. After Jupiter, the head of the divine world, comes Mars, the defender of the city, father of Romulus and of the Roman people, and Quirinus, the deified Roman! god, and in a way the god of the city. Juno was composed of Jupiter, with his sister and consort Juno and his daughter Minerva. Beside them in reverential honor was worshipped Vesta, goddess of the sacred fire and of the household hearth, while Mars, the groundwork of the state. The deities just mentioned, together with the protective or tutelary deities, formed the main body of the state-religion of the Romans—a state-religion of which their second king, the Sabine Numnah, was the revered founder and organizer. Of subordinate importance, but closely intertwined with public life and its concerns, came the worship of abstract, chiefly moral entities, embodied in the religious conception as Virtus, Fides, Fictas. Such deities gradually multiplied according to the appreciation or whim of individuals, till nearly every possible condition or influence, inclined the most to occur rences and agencies, even accidental phenomena, were endowed with divine being, and worshipped accordingly. So we find Orbana, the averter of bereavement and bringer of comfort to its victims, Pessava, the preserver from weariness, Quies, Febris, Advena, Aequora (the goddess invoked on departure and arrival). The natural world, the civic, the moral—the three elements above indicated—were the chief components of Rome’s religion, and during her supremacy constituted the pantheon jealously guarded by the state from every foreign contamination. But with the spread of her dominion, particularly on her coming into closer contact with the Greeks in lower Italy, she imported into her religion extraneous, mostly Greek, objects and modes of worship. She sought to early to revere the oracular Apollo of Delphi, and (422) erected in Rome a temple in his honour as the plague-averting deity. Castor and Pollux were another acclimatisation, and their temple to them dates from 304. The worship of Asclepius she took from Epidaurus (29). So long as her civilisation and national independence were kept up, foreign cult, though introduced and sanctioned by the state, as something separate from her old constitutional religion, which was thus maintained free from all corrupting or disintegrating infusion. So long as the second Punic war was, however, at that turning-point in her civilisation—in an incredibly short time she became penetrated by Greek influences, and threw wide the door to the mythological traditions of Greece. She did indeed retain, for the most part, the names she had given her gods and the rites by which she worshipped them; but these were gradually undermined and overthrown by Greek notions, until her literature, in so far as it dealt with religion, became impregnated with Greek legend and spirit. Nor was it Greece at her best that Rome followed in this subject to her gods. Greek influences parted with her better traditions, and could convey little but what was sceptical and frivolous of her own or what was superstitious and fleshly of her eastern neighbours. Asia and Egypt, through the inter- mission of Greece, and laterly of Gaul, became the source of a sombre, sensual, degrading cult, which Rome, professedly at least attached to her healthier, more masculine worship, strove fruitlessly to counteract. Augustus did his best to prop up the declining religion through restoration of old usages and festivals, the rebuilding of temples on a more magnificent scale, and the dis- comfiture of superstitious importations. Ovid made himself the poet of a similar inspiration in his Fasti, wherein he tried, by reviving the old forgotten ceremonial, to reawaken the spirit from which these had sprung. Later emperors interposed from time to time in the same cause; but in vain. Religion and morals deteriorated with a rapidity that helps to explain the steady, irresistible decline of that religion of which Rome became the seat.

The relocation in Rome of its history: Mommsen’s History of Rome; Fastel de Coulanges, La Cité Antique (1864); Bouche-Leclercq, Histoire de la Divination dans l’Antiquité (4 vols., 1879-92); Roscher, Ausführ. Lexikon der Griech. u. Röm. Mythologie: and Gaston Buisson’s La Religion Romaine should be consulted for fuller information, and the excellent article in the Encyclopedia of the Kloss. The same; also Jean Reville, La Religion à Rome sous les Empire (1856).

Rome, (1) capital of Floyd county, Georgia, on the Coosa river, 72 miles by rail NW of Atlanta. It has iron-foundries, and manufactories of ploughs, nails, &c., and ships cottens. Pop. (1880) 3877; (1900) 7291.—(2) A city of New York, on the Mohawk River, 10 miles by rail NW of Utica, and at the junction of the Erie and Black River canals. It contains a number of mills and manufactories of iron, brass, copper, and other goods. Here is Fort Stanwix, which was successfully defended against St Leger, and 6 miles to the southeast of Oriskany was fought, during the Revolution. Pop. (1890) 14,991; (1900) 15,345.

Rome, PRIX DE, the great prize given by the School of Fine Arts and the Conservatory in Paris, consists of a certain sum for four years, during which the recipient is expected to study painting at Rome and to lodge in the Villa Medici. The second prize is a gold medal.

Rome-scot, a name for Peter’s pence (q.v.).

Romford, a market-town of Essex, on the Bourne or Rom, 12 miles ENE of London. It has large cattle and corn markets, iron-foundries, extensive market-gardens, and a very large brewery of Romford ale. The church of St Edward the Confessor was rebuilt in 1850. Romford is the capital of the Liberty of Havering-atte-Bower, one of the parts of the lands of the Saxons kings. Pop. (1851) 3681; (1891) 8408. See George Terry’s Memories of Old Romford (1880).

Romilly, Sir Samuel, English lawyer and law reformer, was born son of a watchmaker of Huguenot descent, at London, March 1, 1757. At sixteen he was articled to one of the Chancery clerks, at twenty-one entered himself at Gray’s Inn, and afterwards went to the Midland Grenfell, but found his chief employment in Chancery practice. In 1784 he made the acquaintance of Mirabeau, who introduced him to Lord Lansdowne; in 1790 he published an able pamphlet on the French Revolution. In 1806 he was, at the instance of Mr Fox, appointed Solicitor-general in the Grenville administration, and was compelled to accept the honour of knighthood. He took his seat for Queenborough, as in later parliaments for Horsham, Wareham, and
Arundel. He now devoted himself, by pamphlets and oratory, to the abolition of the slave trade. He became one of the leaders in the House of Commons. In his last years he was deeply interested in the welfare of the poor and in educational and religious matters. He was a strong supporter of the English Constitution and a firm friend of the Whig party. He died in 1821, and his influence continued to be felt in the political life of the country for many years to come.

ROMNEY, 1784.

One of the most celebrated landscape painters of the 18th century, he was born in the county of Kent. His early training was in the studio of his father, a颇为出色的 portrait painter. Romney's landscapes are characterized by their准确性 and clarity of detail, and their strong emphasis on natural beauty. He was a great favourite with the aristocracy and was frequently commissioned to paint portraits of members of the royal family. He died in 1865, leaving behind a large body of work that continues to be admired today.

RONDEAU, 1774.

A French poet, he is best known for his collection of love poems, Les Fleurs du Mal, which was published in 1857. These poems are characterized by their intricate imagery and their exploration of themes such as love, death, and the natural world. Rondeau's works have had a profound influence on French literature and continue to be studied and appreciated today.

ROMNEY, NEW. A new borough and Cinque Port in the south of Kent, 8 miles SW. of Hythe. It ceased to be a port in the days of Edward, and is now not even on the sea-shore or on the coast.

ROMNEY, George, painter, 1734-1802. Born in Hampshire, he was educated at Trinity College, Cambridge, and became a lawyer. He was a prolific painter and his works are characterized by their accuracy and attention to detail. Romney's landscapes are particularly celebrated for their representation of the English countryside, and his portraits of the royal family are also highly admired. He died in 1802, leaving behind a large body of work that continues to be studied and appreciated today.

ROMSEY, 1791. A town of Hampshire, 9 miles NW. of Southampton. A fine church, the Caxton Abbey, founded by Richard Caxton, is a notable feature of the town. The church was founded in 1087 and is one of the oldest in England. It is characterized by its beautiful architecture and its significant role in the history of the country.

ROMY, 1802. A town in the district of Bordeaux, in the Gironde. It is a port and a centre of the wine trade. The town is famous for its produce, particularly its wine, which is highly regarded.

ROMY, 1852. A town in the department of Eure-et-Loir, in the region of Centre-Val de Loire. It is a centre of the wine trade and is known for its produce, particularly its wine, which is highly regarded.

ROMY, 1873. A town in the department of Indre-et-Loire, in the region of Centre-Val de Loire. It is a centre of the wine trade and is known for its produce, particularly its wine, which is highly regarded.
Rondo (Ital.), the most obvious and elementary form in music in which the first subject, clearly marked out, followed by other or lesser definite, recurs again in its original key. In later developments the repetition may take place twice, thrice, or even four times, sometimes in part only, or in modified form, the intervening sections being varied in different ways. A large proportion of songs and instrumental pieces are in this form: and the final movement of a sonata, symphony, or concerto is frequently a rondo.

Rondo, till 1872 a post-village of New York, with a pop. of 10,000; now part of Kingston (q.v.)

Ronge, Johann. See German Catholics.

Rousard, Pierre de, French poet, born at the Château de la Poissonnière in Vendôme, September 11, 1524, served the Dauphin and the Duc d'Orléans, and accompanied James V, with his bride, Marie de Lorraine, to Scotland, where he stayed three years. Becoming deaf, he abandoned arms for letters, and at the Collège Coqueret studied with Du Bellay and other members of the famous Pléiade. His Odes (1530) excited violent opposition; his Satires and Récits (1536) appeared his Amours and the fifth book of his Odes, his Hymne in 1555, in 1600 Œuvres Complètes, and in 1572, just after the St. Bartholomew massacre, La Franciade, a fragment of an epic. Charles IX. heaped favours upon the lucky poet, who spent his later years with his friend Anne of Austria in Croisy; Val in Vendôme. He died at his priory of St. Cosme at Tours, December 27, 1585.

See editions by Blanchenain (1857-67) and Marty-Levaux (1858-91); Sainte-Beuve's Œuvres choisies de Rousard (1826); and studies by Sechehée (1874), Chalançon (1875), Bisot (1891), and Pieri (1896).

Röntgen, Wilhelm Konrad von, physicist, born 27th March 1845 at Lennep in Rhenish Prussia, studied at Zurich, and became professor at Strasbourg, Giessen, and (1883) at Würzburg. He has contributed to science on specific lines in gases, elasticity, compressibility, capillarity, the absorption of heat in steam and gases, and especially the X-rays, usually called after him.

Röntgen rays, a peculiar kind of radiation discovered in 1895 by Professor Röntgen, and produced, with comparatively little effort, by a tube called a VACUUM TUBES (q.v.). They pass, with comparatively little absorption, through wood, flesh, paper, and other optically opaque substances, but are strongly absorbed by such substances as metals, bone, and glass. In a general way the 'transparency' of matter to these rays, all rays decreases as the density increases. Their presence is detected by their power of producing luminescence in certain fluorescent substances, such as the platino-cyanide of barium, sodium, or potassium (PHOSPHORESCENCE). A screen covered with a layer of these fluorescent crystals becomes brightly luminous in the neighbourhood of a vacuum tube which is giving out Röntgen rays. When a slab of wood or vulcanite is interposed between the vacuum tube and the screen, the screen still continues to glow. An arm interposed at right angles to the screen, a shadow of a hand, a shadow in the dark central bony structure can be clearly distinguished from the lighter flesh shadows. These shadow-pictures may also be photographed on a sensitive photographic film or plate, and a permanent record secured—an application of immense service to surgery.

It should be noted that there is nothing really extraordinary in optical opaque matter being transparent to other kinds of rays. A similar group of phenomena is met with in the opacity of glass and the transparency (or diathermancy) of rock-salt to the dark heat-rays, although optically both are transparent. Moreover, in their power of exciting fluorescent substances and in affecting the photographic plate the Röntgen rays may be compared to the ultra-violet or ether rays: they have also the property of discharging electrified bodies, a property possessed under certain conditions by violet light. But in almost all other respects the Röntgen rays differ markedly from the rays of visible or of ether radiation. They cannot be reflected or refracted; they suffer no diffraction; they have not yet been polarised.

As to their nature, many views have been advanced. The hypothesis which appears to be most satisfactory is that enunciated by Sir George Stokes, who regards the Röntgen rays as impulses communicated to the ether in an irregular or fitful manner. He gives reasons for believing that the behaviour of ordinary rays of radiant energy, when reflected, refracted, or diffused, depends upon the fact that they are composed of trains of waves periodically associated. In this way the structure of the electric vacuum waves is suggested, which it is possible to regard as a stream of Crookes' radiant matter; but their presence is indicated by the phosphorescence produced on the glass walls. By suitable contrivances the X-rays can be focussed on a definite part of the containing glass wall; and it is there that Röntgen rays are produced in quantity.

In 1894 Philipp von Lenard (an Austrian pupil of Hertz, and from 1896 professor at Heidelberg), following out a suggestion by Hertz, observed what seemed to be a passage of the cathode rays through a thin piece of aluminium which formed part of the containing wall of the vacuum tube. These 'Lenard rays,' as their phosphorescent effects and in their sensitiveness to an approaching magnet, have an undoubted resemblance to the cathode rays. There is no evidence, however, that the cathode rays have then only presence in the cathode tube: in a similar way that their bombardment of the disc on the one side may produce electrical changes capable of starting similar rays on the other. This is the explanation given by Professor J. J. Thomson, whose measurement of the speed of the cathode rays quite disproves the contention (based largely on Le不变's observation) that the cathode rays are ether vibrations. This speed was found to be about one or two hundred miles per second—that is, about 1000 times the speed of light. It was when studying the properties of the cathode and Lenard rays, which seem to differ only in their mode of production, that Röntgen discovered what he himself called the X-rays. A large and increasing literature is now devoted to the discussion of their properties and applications.

Rood (a form of the word rod) is used of the Cross of Christ, the Holy Rood, and of crosses and crucifixes generally, but especially the great crucifix which in mediaeval churches stood on the rood-screen (see SCREEN). As a measure of surface, a rood is the fourth part of an acre, and contains 40 square poles or perches, or 1210 square yards. The square rod or rood used in estimating mason-work is equal to 44 square feet.
In milder and rainier climates, roofs sloping from a central ridge are the ordinary form. Great Greek buildings were covered with marble slabs, carefully grooved together; in common Greek and Italian buildings roofing tiles are used. In the rainy climate north of the Alps steeper roofs are needed to throw off rain and snow.

Fig. 1.

Roofs well constructed serve to bind the walls together and strengthen the building; if too heavy they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in 'principals' or 'trusses.' Fig. 1 represents a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is used for wider spans, and leaves the centre clear for attic. Early Christian basilicas (and probably the Roman basilicas) had such roofs. In the early Gothic style the king-post was curved and the tie-beam moulded. The Decorated style introduced an arch or a series of cants (fig. 3). As the style progressed curved braces were placed under the tie-beam, to support it; these were carved, and rested on elegant corbels, the spandrels between them being filled with tracery. In the Perpendicular style the central part of the tie-beam is cut away, and the beautiful hammer-beam roofs of the period became usual (see fig. 4). The roof of Westminster Hall is one of the finest examples of this kind of roof. These open timber-roofs are much used in England both in churches and halls, but abroad chiefly in the latter, as the church roofs were more frequently vaulted. In modern times, when great spans have to be roofed over, combinations similar to those used in latticework bridges (see BRIDGE, Vol. II. p. 411) are required. Iron has been introduced, and by means of it, spaces of almost any width can be roofed over. See also CEILING, MANSARD ROOF, FAN-TRACERY, &c.

Rook (Corvus frugilegus), a species of Crow, common in Britain and in many parts of Europe and Asia, especially in northern and central regions. In late autumn there is a migration from the Continent to the eastern shores of Britain, and a return in early spring. Some of the characters of the rook have been contrasted with those of other species of Corvus in the article Crow. The plumage is bluish black; the forehead, cheeks, and throat are bare; the bill, legs, and feet are black. White and piebald spots sometimes occur. The rook does not breed till it is about two years old. The nest, built of twigs with a lining of grass and roots, is almost always on a lofty tree. The noisy cawing of the builders in March is one of the familiar signs of departing winter. The eggs (three to five) are bluish green with olive-brown markings. As to food, the rook is almost omnivorous, but it depends in great part on insects and grubs. Unlike the crow, the rook is characteristically a social bird, feeding in great flocks, nesting in rookeries, and sometimes combining to beat off a common foe. Confident perhaps in their numerical strength, and reliant on their habit of posting sentinels, rooks are by no means shy, for they sometimes nest in the trees of a town garden, and, though much afraid of a gun, soon grow accustomed to scarrecrows and noise. They are very wide-spread birds, exhibiting no small degree of that acuteness which is often displayed by gregarious birds and beasts. They show sagacity in choosing fit trees on which to nest, in posting sentinels who warn the others when danger threatens, and in distinguishing real from fictitious sources of alarm. Though quarrelling and mutual robbery are common during the nest-building, there is no doubt that rooks have a sort of social feeling, which manifests itself sometimes in the punishment which they inflict on an offending member. The same rooks seem to take possession of their old nests year after year, repairing the damage done by the winter storms. The male rook feeds the
female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones, and the nestlings are provided with little stones essential to the grinding of the food in the gizzard. The rook can be tamed, and may exhibit something of the inclination to peck possessed by several related birds. While rooks are useful in so far as they destroy many injurious insects and grubs, they sometimes damage trees by breaking off the twigs, they root up grass and young corn, and do other damage to the crops. In moderate numbers they are useful, but in multitudes they are compelled to leave their natural food and become injurious.

Rooke, Sir GEORGE, British admiral, was born in 1690, near Canterbury, at the country-seat of his father, Sir William Rooke. Entering the navy, he found himself at thirty a post-captain, and in 1699 was promoted to the rank of rear-admiral of the red. He took part in the action off Beachy Head between the Earl of Torrington and a French fleet under Toulouville; and in 1692 he distinguished himself greatly in the memorable battle off Cape La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell. For this he received the rank of vice-admiral of the red, knighthood, and a pension of 4100 a year. In 1702 he commanded the expedition against Cadiz, and destroyed the Plate-fleet in the port of Vigo. In conjunction with Sir Clodgesley Shovel he accomplished the capture of Gibraltar, 21st July 1704. On the 9th August of the same year he engaged off Malaga a much heavier French fleet under the Comte de Touloune, and fought one of the bloodiest of naval battles, the honours of which fairly remained with the English, though the escape of the enemy's fleet through the hazy weather rendered it a somewhat barren triumph. The struggle lasted through nearly a whole day; the French loss was upwards of 3000, the English upwards of 2000 men. Sir George was received with marked distinction by Queen Anne, but, finding the government hostile to him on political grounds, retired, and led the life of a Kentish gentleman till his death, 24th January 1760. See his Journal, edited by Oscar Browning for the Navy Records Society (1897).

Roon, Albrecht THEODOR EMIL, COUNT VON, Prussian soldier, was born at Plessnagen near Kolberg in Pomerania on 30th April 1803, entered the army in 1821, was appointed in 1827 to teach in the cadet school of Berlin, and joined the general staff in 1833. He held amongst other positions that of topographer in the general staff surveys (1833-35), teacher in the military academy (1835), military tutor to Prince Frederic-Charles (1843), and member of the commission for reorganising the Prussian army (1859). He carried the bill for army reform through the House of Representatives; his labours in reorganisation produced brilliant results in the great wars of 1866 and 1870-71. He was made war minister in 1859, and marine minister in 1861, was created count in 1871, and received the rank of field-marshal in 1875. For a few months he was president of the Prussian cabinet, retiring in November 1873. He died in Berlin 23d February 1879. A pupil of Karl Ritter (q.v.), Von Roon used his teacher's methods in an elementary general geography (12th ed. 1868) and a more advanced work dealing with the general geography, ethnology, and politics (3d ed. 1847-53). He was the author of Life of Von Gossler (1879), an anonymous Life (Götterschloss, 1888), and Deutsche Revue (1890-91).

Roosevelt, Theodore, American statesman and author, was born in New York City, October 27, 1858. Graduated from Harvard College in 1880, he soon took active part in the politics of his city and state. He was appointed assistant-secretary of the navy in 1897, but in 1889 became lieutenant-colonel of a cavalry regiment (the 'Rough Riders') recruited largely from among the cattlemen of the western plains, and noted for its part in the fighting before Santiago de Cuba; he was soon made full colonel. In November 1898 he was elected governor of New York, and in 1900, vice-president of the United States; he succeeded Mr McKinley as president in 1901. He is the author of a large number of books. His published works include volumes of hunting and ranching experiences, history, and biographies.

Root, in its physiological rather than its strictly morphological sense, is that part of the plant which (1) absorbs nourishment from the soil or water and not from the air; (2) fixes the plant to the earth, and grows downwards into the earth, and away from the light, not upwards, and towards the light, as 'shoots' do; this will include the complex roots of the seed plants, the rhizoids of cryptogams, and the mycelia of fungi, in contradistinction to all those parts of plants which grow upwards towards the light and produce reproductive organs, which may conveniently be called shoots. But organs morphologically of the same kind may have different forms and different functions; thus shoots may function as roots, and roots may grow up into the air as new reproductive organs. Further information as to the physiology of roots will be found in the article upon VEGETABLE PHYSIOLOGY; in this article it is chiefly the morphology of roots that will be dealt with.

As the leaf surface of a seed plant is developed the root system grows; in a large sunflower it occupies about one cubic yard, in a large tree hundreds of cubic yards. This system, resulting from the branching of the primary, secondary, and other roots, the ultimate divisions consisting of root-hairs, is so complete that scarcely the space of a quarter cubic inch is unoccupied. Abundance of water, to balance the transpiration, and of salts, for other purposes of plant-life, is thus secured. The root system of aquatic plants is small, water being easily obtained and transpiration slight.

All roots at first are thin hair-like organs; the greater thickness that those of the dicotyledons attain is due to a secondary growth. The thickened roots serve only as organs of attachment, and of course as conductors of water and salts. Their chief functions as organs of absorption. Those absorbing parts, root-hairs, are protuberances of the outer layer of cells of the roots. They arise shortly behind the growing tip, and they die off in a few days, so that only an inch or two of root bears root-hairs. In this way the root-hairs come into contact with portions of untouched soil.

A longitudinal section near the apex of a root of a seed plant shows the following arrangement of
parts. Near the apex is the growing-point, a mass of actively dividing cells, called the primary meristem; by division these give rise to, below, several layers of simple cells (the root-cap), above, the main meristem; above the latter, in turn, is the epidermis. Above the primary meristem, consists merely of simple meristem cells. A little higher up the meristem differentiates into three layers—the dermatojen, the periblen, and the plicrome. These undergo further differentiation, so that a mature root consists of the following parts: (1) an outer layer, the epidermis, developed from the dermatojen; (2) several layers of simple cells, the cortex, developed from the periblen; (3) the fibro-vascular cylinder, an innermost mass of simple cells, and the pith, both developed from the plicrome. The root-cap serves as a protection to the delicate growing-point of the root as it forces its way through the soil. It is continuously worn away by the particles of the soil, and as continuously reformed by the primary meristem cells. The epidermis binds the whole together, and many of its cells develop into long hairs, the absorbing root-hairs already mentioned. The cortex has no special function. The bundle sheath, when it occurs, separates the cortex sharply from the rest of the root. The fibro-vascular cylinder is the part of the root that acts as the channel for the ascending water and salts (excretions) and, in some cases, of the tubes of attachment. The cylinder consists of smaller bundles of wood vessels and of bast fibres arranged alternately. The centre of a young root is occupied by pith.

Secondary thickening may occur in roots as in stems of the is due to the formation of a layer of actively dividing cells, the cambium. The bundles of wood and bast are placed alternately in a cylinder, and the cambium ring seen in transverse section waves in and out so that it passes inside the base or outside the apex. This result of this is that the secondary thickening of roots results in a mass of tissue similar to that formed by secondary thickening of stems (see stem). Thickened roots usually lose their original cortex and epidermis and gain a fresh covering in many cases it is a woody one. Root sheath or endodermis, is differentiated which envelops the fibro-vascular cylinder; within this lies a layer of parenchyma, simple tissue; it is called the pericambium or phellogen. This layer gives rise to the new covering, which consists of two parts, phelloderm and periderm (which is of cork), corresponding to the original cortex and epidermis.

Forms of Roots of Seed Plants.—The primary root is merely the enlarged radicle of the seedling; it is the direct prolongation of the stem. All secondary roots arise from this first root; the secondary roots may give rise to others and so on until the common much-branched root is formed. If the primary root is very thin the whole system is called a fasciculated root; if the secondary fibres are also very fine it is called a fibrous root (e.g. the lilies). If the fibres are very much thickened it is said to be a tuberous root (e.g. the dahlias). When the primary root is much thicker than the secondary roots it is called a tap-root, and may be further classified according to its shape, as spindle-shaped (e.g. the carrot) or turbin-shaped. Much thicker, however, are the roots of woody plants, e.g. the fasciculated root of the Turk's cap, lily, or the tap-root of the turnip. Roots are also described as fleshy (e.g. the beet-root), or as woody (e.g. the roots of trees). Fleshy roots usually die in the autumn; woody roots may live for many years, even when the shoots die down every autumn. Roots are usually buried in the soil, but they may be aerial, as for instance the roots of climbing plants such as ivy; these arise from the stem and fix the plants to their supports. In the tropics many plants have aerial roots; thus the mangrove forms forests in the swamps. The Indian fig has many aerial roots which become fixed in the ground, new plants may spring. Orchids are examples of the Epiphytes, which have aerial roots which merely fix the plants to trees but do not derive any nourishment from them. Aquatic plants often have roots which do not penetrate into the mud but grow outwards and become fixed in the ground. Many plants will form new roots after all the old ones have been cut off if they are placed in water or in a damp soil. This is taken advantage of by gardeners in their method of propagating such plants as fuchsias, oleanders, &c. from cuttings.

Essential roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant, and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the Tuber (q.v., Bulb (q.v.), and Corn (q.v.), are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order Cruciferae, as the turnip and others of the genus Brassica—some of the order Coniferae, as beech and mango, worman; some of the group Urticifera (e.g. dandelion, parsnip, &c.) and some of the order Liliaceae.

Comparative.—Most of the Thallophytes (Alge, Fungi, and Lichens) have only a rudimentary differentiation into stem, leaf, and root, or none at all; but the most highly developed members of those groups which have a well-developed stem, have a simple system of division of parts to which such terms may be given; still the roots even of these are distinguishable from the roots of vascular plants by the absence of a root-cap, and by their branching, which is never endogamous.

The Vascular plants are divided into two classes, the Lycopsida, &c. are highly differentiated in form and in their tissues. The roots arise in acropetal succession on the stem, or in many ferns on the petioles; their branching is monopodial or dichotomous; they are all alike—the first root never becomes like a tap-root. The lateral roots are of two kinds: the primary root, which gives rise by successive divisions of an apical cell. The Selaginella, a group of the Lycopodinae, are remarkable for having true roots, but a few have no root-caps on them. The growing-point too is formed by a primary meristem and not by a real cell.

The roots of the Seed Plants, consisting of Gymnosperms—i.e. Cycadee, Conifer, Taxacee, and Gnetacee, and of Angiosperms—i.e. Monocotyledons and Dicotyledons, have already received a general description; a few points of comparison may here be repeated. The primary root is a continuation of the primary stem; it is directed towards the micropyle of the embryo-sac (see ovule), and even it is of endogenous origin, its first rudiment being covered by the nearest cell of the suspensor. All the parts of the seed plants, shoots, stems, and roots as well as roots, are distinguished from the parts of all other plants, except the Lycopodinae, and for a short time the embryos of some Coniferae, by having a small-celled primary meristem at the growing apices instead of the typical apical cell of many Algae, and of the Muscéaceae, Lycopodinae, ferns, and Tmesipteris. The apical cells in the cryptogams, not as in the cryptogams, by transverse divisions of an apical cell, but by rapid division in the direction of the apex, and in gymnosperms from the periblem, in angiosperms from the dermatojen. Also the first rudiments of lateral roots, shoots, and leaves do not arise from single cells, as in the cryptogams, but from protuberances of a few small cells. The formation of a close cambium ring in
the primary and stronger lateral roots, and the subsequent secondary increase in thickness, is a characteristic of gymnosperms and dicotyledons, and does not occur in the cryptogams. This habit often results in the formation of persistent root systems, which in the monocotyledons are often replaced functionally by rhizomes, tubers, and bulbs.

The stems of the Cycadeae are not unlike those of the Tree-ferns, but unlike them they have tap-roots. The roots of the C. encephalartos appear above ground. In the Coniferae, the endosperm bursts the seed-coat at the root end, and the root, which develops a strong tap-root with lateral members, is thrust out.

The primary root of monocotyledons soon ceases to grow, lateral roots spring from the axis, each new root spring from a point higher up the stem, and being stronger than the older ones, there is no secondary thickening and no persistent root system. Some saprophytic monocotyledons form no roots at all. In dicotyledons an axis below the cotyledon is called the radicle, but the upper and often the larger portion consists of a part of the stem called the hypocotyl; the lower part is the true embryo root. The root is the first part to issue from the burst seed-coat; it grows and gives rise to lateral roots. If the primary stem grows vigorously, the roots also grow relatively and form a tap-root. If the growth ceases adventitious roots are often formed between the former lateral ones, which may themselves give rise to lateral roots. For further information, see Sachs's Physiologia Plantarum (1887) and Goodell's Classification and Morphology of Plants (1887).

Root-stock or Rhizome is the name given to an underground stem when its shape is cylindrical; to a creeping stem, in short. It is easily distinguished from a root by the fact that it ends in a bud, and bears leaves from which it grows, whereas a root has no bud there and there. In the autumn the aerial leaves die down, but the rhizome lives through the winter, and in the spring its terminal bud goes on growing. Rhizomes are usually by the autumn well stored with reserve food-matter for the use of the bud in the following spring. Examples: the amanama, the lily of the valley, the yellow iris, many ferns.

Root, in Algebra, denotes any value of the unknown quantity in an equation which will render both sides of it identical (see EQUATIONS, INVOLUTION). The square root is that number which, multiplied by itself, gives the given number; the cube root, the number whose cube, multiplied into itself and then into the product, produces the given cube; so with fourth root, fifth root, &c. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of Algebra.

Root-parasites, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the Broom-ropes (Orobanchaceae, q.v.), species of Thesium, &c., and the Rafflesia (q.v.); with other Rhizanthaceae (q.v.).

Ropes. The staple fibre for ropes has long been Hemp (q.v.), but since the middle of the 19th century many other fibres have come largely into use. Hemp is better suited for cordage (the general term for ropes, cords, and twine of all kinds) than for weaving purposes, because it gives way when much folded into sharp folds more readily than other important textile fibres. Jute, for instance, (Manihot esculenta or Manihot tex-tilis; see ABACA), belonging to a quite different order of plants from the common hemp, makes the strongest ropes now manufactured, and is largely employed. Coir fibre, from the husk of the cocomut, is also an important rope-making material which, though long used in India, has in Europe only taken its place as a valuable cordage fibre in comparatively recent years. It is fairly strong, and, size for size, it has the advantage of being considerably lighter than either hemp or manila. Unlike these fibres, hemp is never employed as a rope. Sisal hemp, from the Agave sisalana of South America, though not nearly so strong as common hemp, is also much used, especially for ropes of small size. For certain purposes, such as driving parts of textile machinery, cotton ropes are largely employed. There are only two other rope fibres which as yet can be said to be of any importance in Britain—viz., the Sunn hemp (Crotalaria juncea) of India and the Phorviun tenax of New Zealand. A large number of plants valuable for cordage grow in India, for a list of which, as well as for an account of the native process of rope-spinning, see Balfour's Cyclopedia of India.

As regards the strength of ropes, it will be readily understood that in this respect specimens of the same kind of vegetable fibre will vary considerably. Healthy plants will yield a better fibre than those of more feeble growth, and some supplies of the same kind of material will have been more carefully prepared for spinning than others. The amount of care and skill bestowed upon the spinning process itself will also vary with the skill of different manufacturers. Tarred ropes, again, though more durable, are not so strong as when left untarred; and as tar is liable to be impure it will happen that it weakens or injures the fibre more at one time than at another. These matters will partially cancel each other out in an unimportant way and frequently occurs in the strength of two similar ropes which might be supposed to be equally strong. In the valuable work by W. G. Kirkaldy on his father's System of Mechanical Testing (1891) he gives the breaking stress of a large number of tested ropes, and in his remarks on this section of his experiments points out that the strength of some of these is much lower than it ought to be. He thinks that this can only be accounted for by adulteration of the fibre. It is probable that jute is sometimes mixed with better material. In one instance he found some rubbish called 'batch' hidden inside the rope. The following examples will show approximately the comparative strength of ropes made of three different materials. They are taken from a table supplied by Mr. Kirkaldy, and show the results of the testing of seventy specimens of ropes.
is above the average. Mr Kirkaldy states that the calculated ‘stress per fathom-weight,’ by a method akin to calculating the tensile strength per square inch of metals from actual tests, gives a more useful basis to compare the value of ropes than the breaking stress does. This stress per fathom-weight in each of the above examples was: hemp, untailed, 3457 lb.; hemp, tailed, 2631 lb.; manilla, 625 lb.; cotton, 2860 lb.

Rope-making by Machinery.—By this is understood the making of ropes by machines which do their work without the necessity of having a rope-walk. The hecketing, the drawing, and the spinning frames for preparing rope yarns are the same in principle as those used for spinning linen yarn for weaving purposes. There is, however, some difference in detail, owing to the greater average weight of rope yarn, so that, for example, there are comparatively few bobbins on the spinning-frame proper. Separate machines are perhaps more generally used for making strands and for laying these into ropes than compound machines which perform both operations, especially for very thick ropes. All these are now made of different designs, and with a good deal of variety in their details. The雪山 follies, as well as the Hanoverian and the Guittinane's patent compound rope machine will give a fair idea of one of the newest forms of this kind of apparatus. It was constructed to make three-strand ropes up to 35 inches in diameter, there being in the one here figured six bobbins for each strand. It is furnished withchange wheels, to enable either hard or soft laid ropes to be made. From a fuller description in The Engineer (7th March 1890) we extract the following: ‘The yarns being wound round on the bobbins in suitable numbers, according to the size of the rope to be made, they are from each bobbin threaded through a head-runner (register-plate) of six holes, and gathered at a die at which they are closed into strands, there being a separate die for each of the three strands. The strands being formed, they are then threaded through a main head-runner of the holes, and immediately closed at the main closing die into a finished rope. The rope is drawn over the die by means of strong hauling-off drums, and ultimately wound on a storage reel.’—Wire-ropes (q.v.) and textile fiber ropes are now largely employed for driving machinery instead of belting.

Roquefort (Lat. Rocca), ST, the patron saint of those sick of the plague, and the enemy of cattle- plauge. He was born in Montpellier, about 1205, devoted himself to the care of the sick from the plague, especially in Italy, and died in 1327.

Roquefort, a village in the French department of Aveyron, situated on the western edge of the Causse plateau, 44 miles N. by W. of Béziers and 10 SW. of Millau, and celebrated since Roman times for its ewe-milk cheeses. Pop. 973.
**Rorqual** (Balaenoptera), a kind of baleen whale, to which the names of **Razer-back**, **Flower**, and **Razor-back** are also applied. The genus includes the largest and some of the commonest whales, and is represented in all seas. The head is flat and pointed, the body is slender, the skin of the throat is deeply folded in longitudinal plaits, the whale is short and coarse, and there is not much blubber. The 'blue whale' (B. stellaldis), the largest living animal, may attain a length of 80 or 85 feet. It seems to pass the winter in the open sea, and approaches the coast of Norway at the end of April or beginning of May, and is sometimes stranded on British coasts—for instance, in the Firth of Forth. The Common Rorqual (B. acutoce- lopus) attains a length of 60 to 75 feet, and it often comes ashore on British coasts. Rudolph's Whale, or Northern Rorqual (B. borealis), does not exceed 50 feet in length; and yet smaller is the Lesser Rorqual (B. rorutata), which measures about 30 feet. The former is not uncommon in the more northern seas, while the range of the latter extends from the Mediterranean to Davis Straits. The rorquals seem to feed on small crustaceans, and sometimes on small fishes. Though not nearly so valuable as species of Baleen, they are often captured by the whalers. See WHALE.

**Rosaceae**. A natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty and fruit. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphro- dite, but sometimes unisexual; the inflorescence various. The calyx is 4 to 5 lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx, or occasionally from the ovary in a band. The ovary is often 3-celled, with a lateral style, or a number of styles united into a many-celled pistil; the ovules generally two or more. The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes a nut; sometimes a collection of nuts enclosed in the fleshy tube of the calyx; sometimes a collection of small drupes forming a head, as in the raspberry; and sometimes, as in the straw

**Rosa**, CARL, whose real surname was **Rosse**, was born at Hamburg on 22d March 1843, and studied music at Leipzig and Paris. After conducting a concert and operatic tour in the United States in 1871-72, he came to England, his intention being to produce standard operas with an English text. But it was 1875 before he was able to carry out his intention. London gave him little encouragement; the prejudice against English opera was too strong. The provinces, however, welcomed the new undertaking and made it successful. Carl Rosa may be called the father of English opera in two senses: he not only produced the great operas of German, French, and Italian composers with English texts, but he encouraged native composers to write operas, by giving them commissions for works. It was in this way that such operas as Goring 'Thames' (1881), 'Rome and Jerusalem' (1895), and Mackenzie's 'Columbia and Troubadour, Dr V. Sanford's 'Canterbury Pilgrims,' &c, came to be written. He died 30th April 1889. Madame Paragua-Rosa (1839-74), a distinguished vocalist, was his wife.

**Rosacea**. See AUCK.

**Rosacea**, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty and fruit. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphro- dite, but sometimes unisexual; the inflorescence various. The calyx is 4 to 5 lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx, or occasionally from the ovary in a band. The ovary is often 3-celled, with a lateral style, or a number of styles united into a many-celled pistil; the ovules generally two or more. The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes a nut; sometimes a collection of nuts enclosed in the fleshy tube of the calyx; sometimes a collection of small drupes forming a head, as in the raspberry; and sometimes, as in the straw
berry, it is an enlarged fleshy receptacle with the seeds imbedded on its surface. This natural order contains at least 1000 known species; but in some of the genera, as Rosa and Rubus, the determination of the specific limits is difficult, and some—sometimes reckoned species—are numerous. The order, as generally received, is divided into a number of sub-orders, several of which have by some botanists been elevated to the rank of distinct orders, as many of the Pomoceae, Sanguiisorus, B. Rubus, Strawberries, Rubus, Rubus, Tormentilla, Toxaitis, Agrimony, Geum, Spirea, Cusso, &c.

Rosamond. See Clifford.

Rosario, the third city of the Argentine Republic, and the largest in Santa Fé, is on the west bank of the Paraná, 190 miles by rail N.W. of Buenos Ayres, 210 miles by river. It has an excellent harbour, and carries on a large commerce direct with Europe; the exports exceed $3 and the imports 5 sterling. The houses for the most part are of single story; for the rest, the city is laid out on, a smaller scale, on the lines of Buenos Ayres, with narrow streets, ill paved, few and paltry plazas, and only one monument of note, a lofty marble shaft (1853) to that figure of Voltaire surrounded by four statues. Tramways (with 6 miles of rails) run in every direction, and there is a telephone to Buenos Ayres. The city possesses an exchange, a theatre, a great bullring, two markets, hospitals, steam-elevators, sugar-factory, &c. Rosario was founded in 1725. Pop. 1857, 135,000.

Rosary, a string of larger and smaller beads used by Catholics as an aid to memory in keeping account of the number of Paternosters and Ave Marias recited. There are various patterns in use; a very ordinary one is a rosary of fifty-five beads, fifty small ones for the Ave Marias, separated into groups of ten by five large ones to mark Paternosters. The custom of reciting the Lord's Prayer many times in succession dates from a very early period of the Christian church; the custom of keeping a note of the prayers recited by means of strings of beads was.first adopted in the East among Hindus and Mohammedans that the use of the rosary for this purpose has been said to have been introduced into Christian Europe by the Crusaders. The name (Lat. rosarium, 'a garden of roses' or 'chapellet of roses') first occurs in the 13th century, and seems to have been derived from Rosarium mysticum in a form given to the Virgin herself, or from a set of prayers being thought of as the Virgin's rose-garden; less probable is the suggestion that the name comes from the beads being originally made of rosewood. The beads are now of various materials—berries, wood, stone, ivory, metal, &c., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose. The rosary is also given to the Rosary of the Blessed Virgin consisting of fifteen decades, comprising fifteen Paternosters and Doxologies, and 150 Ave Marias, divided into three parts. The Lesser Rosary consists of one of the three parts, comprising five decades or mysteries.

Rosas, Juan Manuel, Argentine dictator, was born in Buenos Ayres, 30th March 1793, entered the army of Buenos Ayres in 1810, was appointed to the Order-in-chief in 1826, and was governor of the province from 1829 to 1832. Then, being disappointed of re-election, he headed a revolt, and in three years succeeded in obtaining office again, with extraordinary powers. From 1835 to 1852 he governed as dictator, not of Buenos Ayres alone, but practically of the interior also. His rule was a rule of terror and nearly constant bloodshed; one of his chief opponents published, so early as 1843, a detailed list of 22,405 victims of the relentless savagery with which he pursued his policy of extermination against his opponents, among the advocates of centralisation, that is to say, as opposed to the Federalists, for whose principles Rosas professed to contend. Many refugees found an asylum in Uruguay, and therefore Rosas willingly supported the attempts of his partisan, General Orle, to make himself master of his republic, and, after the fall of Orle's government, Rosas in 1839 invaded Uruguay with 7000 men, was defeated, and in 1843 sent Orle back with an army of 14,000 men to attack Montevideo. The long siege which followed led to the joint intervention, in 1845, of England and the United States of Buenos Ayres (1845-47), and the temporary opening of the Paraná to free navigation. But the river provinces could not be induced to rise against Rosas, until in 1849 a treaty was signed by which he secured for Buenos Ayres the entire navigation of the Plate, the Uruguay, and the Paraná. This aroused the other Latin provinces, and in 1853 Urquiza, the governor of Entre Rios, supported by Brazil with both money and men, defeated Orle in Uruguay, and won over his troops; then, with a force of 30,000, he marched against Rosas, and on 3d February 1852 routed him at Monte Casto, near Buenos Ayres. Rosas escaped to England; and, although the Argentine congress in 1861 condemned him to death as a 'professional murderer and robber,' specifying 2004 assassinations carried out by his orders, he lived comfortably near Southampton until his death 14th March 1877.

Roscellins, See Scholasticism.

Roscher, Wilhelm, the most eminent exponent of the historical school of Political Economy (q.v.) in Germany, was born at Hanover on 21st October 1817. He studied at Göttingen and Berlin, and in 1843 was appointed professor of Political Economy at Göttingen, but in 1848 was called to fill the corresponding chair at Leipzig. His principal works are System der Volkswirtschaft (4 vols. 1834-36 ; 15th ed. 1887; 21st ed. 1894; Eng. trans. 2 vols. Chicago, 1879), Die Nationalökonomie des Ackerbaus (10th ed. 1894), Grundlagen der Nationalökonomie (17th ed. 1884), Geschichte der Nationalökonomik in Deutschland (1874), Zur Geschichte der englischen Volkswirtschaftslehre (1851-52), Kolonien, Kolonialpolitik und Auswanderung (3d ed. 1883). He died 3d June 1894.

Roscius, Quintus, was born at Solonium, a village near Lahoscium, and rose to be the greatest comic actor in Rome. So great was his success that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favour, presented him with a gold ring, the symbol of the equestrian order. Among his most admired and affectionate patrons Roscius also numbered Cicero, who, at the commencement of his career, received lessons of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effec-
tively—the orator by his diction, or the comedian by his gesticulation. So sensible was Roscoe of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the art, and compiled methods and rules for improving himself in writing and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chereca for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 B.C.) in his extant oration, Pro Q. Roscio Condito. He is said to have spent 10 years of his life in practising this art; and his accomplishments and perfection in his peculiar art that to be a 'Roscius' became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, Apollus the tragedian, an immense fortune, realised the stage. See Ribbeck, Die Botenische Tragodie (Leip. 1783).—For the 'Young Roscius,' see BETTY.

ROSCOE, William, historian, was born at Liverpool on 8th March 1733, his father being a market-gardener. In 1769 he was articled to an attorney at Liverpool, and began to practise there on his own account in 1774. About this time he assiduously cultivated his mental powers, turning his attention especially to the Italian language and literature. In 1773 he first appeared in print as the author of a poem, Mount Pleasant, now forgotten; and in 1787 and 1788 published Wrongs of Africa, an extraordinary protest against the slave-trade. But it was his Life of Lorenzo de Medicis, called the Magnificent (1796), which established his literary reputation; it went through several editions, and was translated into German, French, and Italian. In 1835 appeared his second important book, Life and Pontificate of Leo X. This, like the former, appeared in German, French, and Italian, and was received with much commendation, though its tone and spirit, especially with reference to the Reformation, were severely criticised. About the year 1800 he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. From his pen came, beside the above-mentioned books, a collection of Poems (1857), of which by far the best is 'Kittfoot's Butterfly's Ballads,' and a Monograph of B. R. Jones (1822). He issued an edition of Pope in 1825. Roscoe died at Liverpool, June 30, 1851. During the later years of his life he gave much attention to the study of botany, and wrote a monograph on Monasplian plants. See Life by his son Henry (1835), and Aspinasse's Lancashire Worthies (24 series, 1877).

SIR HENRY ENFIELD ROSCOE, chemist, born in London 7th January 1833, was a grandson of the above, and the son of Henry Roscoe, barrister. He was educated at the Liverpool High School, and later at University College, London, and at the university of Heidelberg. He was appointed professor of Chemistry in Oxens College, Manchester, in 1838, and rendered valuable services towards the organisation of this institution. He was returned un-opposed for the borough of Manchester in 1883, was re-elected in 1886, and in the latter year he resigned his professorship. He has served on the Royal Commissions on Noxions Vapours and on Technical Education, and is a member of the British Association. Honours and distinctions of Chemical science the most important are researches on the measurement of the chemical activity of light, and on vanadium and its compounds. His published works include Spectrum Analysis, a course of lectures (1868) on the subject; his well-known Lessons in Elementary Chemistry (1870); and his Treatise on Chemistry (written in conjunction with Schorlemmer), in 3 vols. (1878-89; new ed. 1894 et seq.). He lost his seat in parliament in 1895.

Roscoff, a seaport on the north coast of the French department of Finistere (long the headquarters of smugglers into England), 33 miles N.E. of Brest. The trade are all sail, as all livestock and vegetables. The place is resorted to for sea-bathing, and here is a marine zoological station. The garden of the Capuchin monastery contains a fig-tree whose branches, trained over scaffolding, would give shelter to 200 people. Pop. 1731. Here Mary Queen of Scots landed in 1548, and the Young Pretender after his escape from Scotland.

Roscommon, an inland county of Connaught, Ireland, is bounded on the E. by the Shannon, and on the W., in part, by the Suck; it is 62 miles long from north to south, by 26 miles from east to west. Area, 607,691 acres, of which barely one-fifth is under crops (hay, potatoes, oats); more than one-half is permanent grass; one-sixth is waste. It belongs to the central plain of Ireland, but rises in the north into the Curlew (800 feet) and Brandon (1,527 feet) mountains. Several lakes occur, as Allen, Bodeg, and Ree, expansions of the Shannon, and Key, Gara, and Glena in the north-west. The soil in the central districts is in general light, but fertile, and affords some of the finest sheep-pasture in Ireland in the 'Plain of Boyle.' The chief industry is the rearing of sheep and cattle, especially the former. Coal and iron exist, but are not worked; there are no manufactures. The chief towns are Roscommon, Boyle, Castlerea, Elphin, and Strokestown. Pop. (1841) 25,411; (1851) 13,149; (1881) 14,831; of whom 110,147 were Roman Catholics. Roscomon sends two members to parliament, one for each of the divisions. It possesses a number of Celtic antiquities, raths, &c., several remains of strong castles, and some fine ecclesiastical ruins.

Roscommon, the county town, 96 miles W. by N. of Dublin, dates from the 13th century, when it arose around a Dominican abbey, founded by the O'Conor in 1257, and a castle built ten years later by Sir Robert de Ufford; the remains of both still exist. Roscommon, pop. 2,117, has an important cattle-market.

Roscrea, a market-town of Tipperary, Ireland, 77 miles S.W. of Dublin, is a very ancient town; here St. Croman built a church, and had a celebrated school in the 7th century. Considerable remains of a castle, a lofty round tower 80 feet high, and ruins of two abbeys exist. Pop. 2,901.

Rose. The rose, the most lovely and fragrant of flowers, the favourite of poets and the national emblem of England, is a shrub or sometimes a tree, very widely distributed, and giving name to the large and comprehensive order Rosaceae, to which some of our choicest fruits belong. Restricting ourselves to the genus Rosa, which alone we acknowledge as the rose, we find the characteristics thus: shrubly growth, stems generally prickly, leaves alternate, stipulate, flowers terminal, often corymbose, spreading with petals, in colour white, yellow, crimson, red, staminating; petals numerous, styles exerted, seeds (achenes) numerops, enclosed in a fleshy berry, globular or oval, which is known as the hip or hop, and is in some sort edible. The calyx is generally five-lobed, and the petals are usually 5, or 10, or 20, or 25, or 40, (as in the rose moss) furnished with a beautiful process of filament.

(1) The wild rose is a native of the northern
hemisphere, found in all temperate climes, and even as far south as Abyssinia, the Indian Peninsula, and Mexico, extending also to the Arctic zone, and of such diversity that more than 200 species were admitted by former botanists, which have now been reduced, however, to less than a fifth of that number. In Britain we find it indigenous as *Rosa spinosissima* (the Burnet-rose, from which descend the many varieties of Scotch rose); *Rosa canina* (the Dog-rose of our hedges, with several sub-varieties); *rubiginosa* and *micrantha*, well known as the Sweet Briars; *arvensis*, a prostrate and unfragrant kind; *tosentosa* and *villosa*, having downy foliage and deep red blossoms. The recent tendency of botanists, gladly accepted by the gardener, has been to restrict the number of species and allow more scope to variety, so that the above list may soon be compressed.

(2) The cultivated rose is a fuller and generally larger form, obtained by the nurture and skill of the gardener, and still receiving improvement by skillful crossing and loving observance. In the *Gardener's Chronicle* of 1885 may be found Mr. Baker's scientific classification of garden roses, which are marshalled into ten companies or groups, chiefly according to leaf and prickle. Mr. William Paul, however, in the last edition of his great work, permits us to reduce these ten groups to six, which will be as follows: Simplefolia, Scented, Banksiana, Decaisne, Centifolia, and Caninae. But the general grower may well content himself with the arrangement in the catalogues of our leading nurseriesmen, as recognised by the National Rose Society, and observed in our chief exhibitions; though the principles of division of the botanical, neither is the broad line drawn betweensummer and 'perpetual' roses always justified by fact; so that many good rosarians now protest against the too popular neglect of a fragrant, lovely, and free flowering class.

(a) Summer roses, thus estranged by a hasty vote, are of many families, and bloom for the most part in June and July—the Bouralt, the Scotch Rose, the Damask, the Providence, the Moss, the French and Hybrid French, the Bourbon and Chinese Hybrids, the Austrian and Sweet Briar, the Ayrshire, Evergreen, and Multiflora, the Polyantha, Prairie, and Banksian roses, as well as some few others. Many of these are of the greatest beauty—for instance, the Moss rose, perhaps the loveliest of all flowers; and some are the best of all for trellis or for pillar, and the hardest in bad weather.

(b) The Perpetual, or *Remontant* rose, as the French more correctly term it, instead of making growth alone after the gorgeous summer show, affords a succession, more or less continuous according to variety and weather, of bud and bloom until the fruits forbid. Yet even with these it is rare to find the aftermath of beauty as free or as fine as the summer crop had been; and many of the so-called perpetuals retire as weekly as the summer rose, especially in dull seasons. Perpetual roses are chiefly as follows: the Chinese or Monthly, the Hybrid Perpetual, the Tea-scented, Bourbon, Noisette, Macartney, Rugosa, Microphylla, Lawrenceana, and Perpetual Scotch. The old Chinese, *Rosa Indica*, commonly called the Monthly Rose, is still popular as an early and abundant bloomer; so are the Bourbons and Noisettes. But the Hybrid Perpetual and Teascented are now the chief favourites of the rose-grower, and have almost engrossed his attention. Of these two classes the former has for many years been undoubtedly the leading rose, but the Tea begins more and more to vie with it in favour, and many rosarians now place it first, for its exquisite refinement, grace, and delicacy, bewitching modesty, and pensive charm. But the hybrid perpetual claims bolder brilliance, more velvety damask, and profundity of glow. And indeed it seems difficult to achieve or conceive more perfect beauty than has already been attained by loving ingenuity and persevering skill in many of the roses we now possess; though manifold gardeners are hankering still for a blue rose, which would not accord with the form and tint of the foliage if they got it.

Roses are also divided, according to the form of flower, into globular, cupped, compact, and expanded, the last named often becoming reflexed in the later stage of bloom; and again, according to modes of culture, into standards, half-standards, and pyramids, bushes, pendulous, pillar, and trellis form. The standards and half-standards, once so popular, are now in less demand, though still approved by those who plant for exhibition, or special effect at a distance; and the bush (the more natural and easy growth) becomes every year more general. For pillar and trellis work there are but few of the hybrid perpetuals and tea-scented sufficing in vigour and hardiness; though certain

---

Fig. 1.—*Rosa rugosa*.

Fig. 2.

*Tea-rose*; *b*, Hybrid perpetual.
strains have been obtained of some of the leading favourites, such as Jules Margottin and Devenoisie, through "sports" (as it is expressed) of the old kind, which serve the purpose fairly; and under glass or in every snug spot that Coprophylans of yellow roses, *Martha Niel*, the green of *Tea-rose*, and other varieties do best upon *La Giffreare*. But as a rule the *Manetti* is a treacherous foster-mother, affording brief vigour, and encroaching with deceptive suckers. Whatever stock may be chosen, the nobler rose is worked over by budding or grafting, and must engross the entire resources again. Apart from roses there are not a few, of delicate constitution or feeble habit, which should be grown in pots and sheltered through the winter. Many also of the stronger kinds are cultivated thus to bloom in the winter and spring, and some are like value otherwise. But they must have plenty of air and light, and will not endure strong forcing. The *Tea-rose*, *Indica odorata*, descended from the Chinese yellowish rose, is grown most largely under glass in pots or border, and being most lovely in the leaf, is especially fitted for bouquets. *Marthcal Niel* (perhaps more correctly classed as a Noisette of late), *Niphetos*, *Catherine Mermet*, and *Sommervil d'en Ame* are at present most popular for this sweet use.

New varieties of the rose are strongly heralded every year, and every season adds one or two lasting names to the lengthy catalogue. But old friends also pass out of date, and are no longer heard of; sometimes from a real advance upon them, sometimes by their own neglect. About 1860 nearly all new roses were the product of ingenious men; but now we get many quite as good from the skill of our own rosarians. The crossing of the flowers is a process needing both judgment and dexterity. But the general grower will be content to cultivate the established kinds, which require no great trouble. Their abode must not be overgrown, nor beset with stagnant water, the soil should be rich and deeply delved, and well-compacted round the neck of the plant. Plenty of water is given in time of drought, and a mulching of good manure is very necessary; and growth of leaf and bud must be secured from countless enemies by daily and even nightly care. Three-quarters of the buds should be nipped off when true discretion orders it. As soon as the first flush of bloom is past, a little judicious pruning helps the prospect of a later crop; for this reason they should not be much shortening of the branches, unless they are threatened by the wind; but the general pruning remains for March.

See books by W. Paul (9th ed. 1888, with 1886 supplement), Dean Hole (15th ed. 1890), Ellwanger (New York), Tasker (cr. 1840), Shirley Hibbert, Sawyer, and French books by Jannin and Forney, Singer, and others in Lachâme. See also Percommont, Otto of Roses; and for the Roman de la Rose, see France, p. 786. Rose is a name for Erythellea (q. v.).

---

Rose, Sir Hugh. See STRATHNAIRN.

Rosebery, Archibald Philip Primrose, Earl of, was born in London, 7th May 1847, was educated at Eton and at Christ Church, Oxford, and succeeded his grandfather, fifth Earl, in 1868. He entered parliament in 1871, acquired in unusual measure the goodwill of the democracy, and was everywhere welcomed as an effective and entertaining speaker. In 1874 he became president of the Social Science Association, and Rector of Aberdeen University, and in 1880 of Edingburgh University. From 1881 to 1885 he was Under-secretary for the Home Department, and in 1884 became First Commissioner of Works. In Mr Gladstone's next short administration (1886) he was Secretary for Foreign Affairs, an office he held till the full of the government six months later; but even in that short period he established for himself a high reputation. In 1883-84 he visited Australia; and he has strongly supported Imperial Federation. In 1884 he moved for a select committee to inquire how best the efficiency of the House of Lords might be improved. He presented a magnificent swimming-bath to the People's Palace in the east end of London, in token of his interest in all movements for the social improvement of the people. In 1889 he was elected by the City Division to the Liberal Unionist Council, and was successful and assiduous as its first chairman till he resigned in 1890. He was re-elected and acted for a few months in 1892, till the political duties of an approaching general election led to his resignation. In 1892 Lord Rosebery again entered the Imperial Administration, but in 1893 Mr Gladstone resumed office in the Liberal Ministry. Lord Rosebery, as head of the Liberal minority in the Commons, became Secretary for Foreign Affairs, displaying, as on the former occasion, a tact and firmness that secured the approval of all parties. On the resignation of Mr Gladstone in 1894, Lord Rosebery became the head of the Liberal minority in the Commons, and secured the confidence of the various sections of his party. His government lost the confidence of the country, and soon after he resigned a general election (July 1895) returned an overwhelming majority for the new Unionist government of Lord Salisbury.

In 1896, finding his opinions on the Armenian problem more in accordance with those of Lord Salisbury than with Mr Gladstone's, he resigned his leadership of the Liberal party to obtain more freedom in giving expression to his views, and strongly urged that a European war should not be risked on this question, when the Fashoda difficulty with France became acute in 1898 he by his speeches strongly supported the government as expressing the resolution of a united nation; and a large section of Liberals continued to look to him as the future leader of the party. In 1878 Lord Rosebery married a daughter of Baron Meyer de Rothschild (died 1890). In 1891 he published a monograph on Pitt in the "English Statesmen" series. He is keenly interested in Scottish history and Scottish literature, and as president has taken active part in the work of the Scottish History Society. Two addresses in connection with the Burns Centenary were printed in 1896. In 1896 a collection (unauthorised) of his political speeches was published, and in 1899 another of Appreciations and Addresses, dealing with Burns, Burke, London, Town Councillors, &c. The first number of the *Anglo-Saxon* (1899) contained an article by him on Peel. Lord Rosebery keeps an extensive racing stud, and in 1894 and 1895 won the Derby with the horses *Lamia* and *Six Visio*. He is LL.D. (Cambridge, 1888), K.G. (1892), and K.T. (1895), and sits in the House of Lords as Baron Rosebery in the peerage of the United Kingdom.

Rose-chafer (Cetonia aurata), an injurious beetle, whose grubs destroy the roots of straw-
berries and other plants, while the adults spoil the flowers of roses, strawberries, and seed-turnips. The eggs are laid in the ground; the full-grown grubs are whitish and about an inch and a half in length; after two or three years they pupate inside earthen cocoons. The adults, which are well able to fly from place to place, measure about an inch in length, are golden green above, coppery with a tint of rose beneath. Where they are likely to do harm the adults and grubs should be collected and destroyed, and recourse may be had to remedies similar to those used against cockchafers. The ‘rose-bug’ of the eastern United States is another beetle (Macrodactylus subcapitatus), a voracious pest which often appears in immense numbers and destroys the flowers of roseaceous plants.

Rosecrans, William Starke, an American general, was born at Kingston, Ohio, 6th September 1819, graduated at West Point in 1842, and was employed as an engineer until 1854, when he resigned, became a civil engineer, and afterwards engaged in coal-mining and the manufacture of kerosene. In 1861 he volunteered as an aide to General McClellan, won an action at Rich Mountain in July, was commissioned brigadier-general in the United States army, and succeeded McClellan as head of the Department of the Ohio, and kept Lee out of western Virginia. In 1862 he commanded a division at the siege of Corinth, and after its capture was given the command of the Army of the Mississippi; on 19th September he defeated General Sterling Price at Iuka, and on 3d and 4th October he successfully defended Corinth against Price and Van Dorn. From October 1862 to October 1863 Rosecrans was in command of the Department of the Cumberland; in the battle at Stone River (December 31 and January 2), against Bragg, he by his personal exertions converted what nearly had been a defeat into a victory, after each side had lost over 9000 men; but at Chickamauga, September 19-20, 1863, he was defeated by Bragg, with a loss of 16,170, although he held Chattaanooga, and the Confederates lost 17,804 men. Rosecrans was relieved of his command by General Grant; but in 1864 he was placed over the Department of the Missouri, and repelled Price’s invasion of that state. He afterwards received the brevet of major-general, and resigned from the army in 1867. In 1868-69 he was minister to Mexico, in 1881-85 a member of congress, and in 1885 appointed registrar of the U.S. treasury. He died in March 1898.

Rosemary (Rosmarinus), a genus of plants of the natural order Labiate, and nearly allied to Sage (Salvia), from which it differs in its filaments having an awl-shaped tooth, directed downwards a little above the base. Only one species is known, R. officinalis, an evergreen creeper shrub of 4 to 8 feet high, with linear leaves, and pale bluish flowers, growing in sunny places, on rocks, old walls, &c., in the countries around the Mediterranean Sea, and cultivated elsewhere as an ornamental and aromatic shrub. The leaves have a short whitish-gray down beneath, a penetrating camphor-like odour, and a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, Oil of Rosemary, which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. Spirit of Rosemary, made by distillation of sprigs of rosemary with rectified spirit, is used to give a pleasant odour to lotions and liniments. Rosemary has been advantageously administered internally in cases of chronic diarrhoea, and of a relaxed state of the system.—

Oil of Rosemary is a principal ingredient of the perfume called Hungarian Water. The celebrated white honey of Narbonne owes its reputation to being collected from the flowers of rosemary. In some places, by a confusion of similar names, the totally distinct plant Costmary (q.v.) is called Rosemary. The name Wild Rosemary is given to Ledum palustre, a shrub with narcotic acrid properties.

Rosendale, a village of New York, by rail 8 miles SSW. of Kingston, or 61 miles S. by W. of Albany, has a pop. (1900) of 1840; it is noted for its great manufacture of hydraulic cement. In 1886, when the United States produced 4,500,000 barrels (300 lb.) of cement, nearly one-half came from the Rosendale district, the rest being drawn from Pennsylvania, Kentucky, Illinois, Colorado, Indiana, Tennessee, and Alabama in varying proportions. Most of the American cement is derived from natural cement rock, as at Rosendale; the rest being ‘artificial Portland.’

Roseneath, or Rosneath, a village of Dumfriesshire, on the SW. shore of the Gare Loch, with a palace of the Duke of Argyll. Pop. 2000.

Rosenkranz, Karl, philosopher, a pupil of Hegel, was born at Magdeburg on 23rd April 1805, studied in Berlin, Halle, and Heidelberg, taught at Halle as privat-dozent (1828), and as professor of Philosophy (1831), in 1833 was called to the chair of Philosophy in Köenigsberg, and there he died, blind, on 14th June 1879. He was a man of wide culture and a voluminous writer, his works including Encyklopädie der theologischen Wissenschaften (2d ed. 1845), Psychologie (3d ed. 1855), Kritische
Erläuterungen des Hegelischen Systems (1849), criticisms of Schleiermacher's (1836) and Strauss's Doctrines of Belief (1845), Meine Reform des Hegelischen Systems (1852), and Wissenschaft der logischen Idee (1858–69) in philosophy, and books on the History of Church and International Law (1860), Leben Hegels (1844), Goethe und seine Werke (2d ed. 1856) in literature. He also edited, with Schubert, Kurt's Werke (12 vols. 1838-40).

See his autobiographical Von Magdeburg nach Königsberg (1875) and Life by Quibbeker (1879).

Rosenmüller, Johann Georg, a German theologian, a native of Erfurt, was born at Unna near Hildburghausen, 18th December 1736, studied in Altдорf, and filled chairs at Erlangen (1773), Giessen (1783), and Leipzig (1785), where he died, 14th March 1815. He published about 100 books of great popularity. Of these the most important was Scholia in Novum Testamentum (6th ed. by his son 1815–31).—Ernst Friedrich Karl, eldest son of the foregoing, was a distinguished biblical critic and Orientalist. He was born at Hesseberg near Hildburghausen, 10th December 1768, studied at Königsgen, Giessen, and Leipzig, became extraordinary professor of Oriental Literature at the last in 1795, ordinary professor in Arabic in 1813, and died 17th September 1833. His Institutiones ad fund. ling. Arab. (1818) and Anecdota Arabica (3 vols. 1824–27) were of great importance; his masterpiece, the Scholia in Petrum Testamentum (11 parts in 23 vols. 1788–1835), still retains no small part of its value. Other works are Handbuch für bibl. Kritik und Exegese (1797–1800), Das alte und neue Morgenland (1816–20), Handbuch der biblischen Alterthumskunde (4 vols. 1833–31).—A younger brother, Johann Christian (1771–1829), was twenty years a professor of Anatomy and Surgery at Leipzig, and wrote on anatomy.

Rose-noble. See Noble.

Rose of Jericho (Anastatica hierochuntica), a plant of the natural order Cruciferae, which grows in the sandy deserts of Arabia, and on rubbish, the roofs of houses, and other such situations in Syria and other parts of the East. It is a small, bushy, herbaceous plant, seldom more than six inches high, with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved towards the centre, so that the plant presents a globular form; and in this state it is often blown about by the wind in the desert. When it happens to be blown into water the branches expand again, and the pods open and let out the seeds. Numerous superstitions are connected with this plant, which is called Rosa Maris, or Rose of the Virgin. If taken up before it is quite withered the plant retains for years its hygroscopic property of contracting in drought and expanding in moisture.

Ross of Sharon, a name given to an ornamental medicinal plant, the Salvia syriaca (see figure). But the Rose of Sharon of the bible was doubtless a bulbous plant, probably a kind of narcissus.

Rose-côl, or Rose-rash, is a name sometimes applied to the milder varieties of Erythema (q.v.), where the eruption consists merely of a reddening of the skin, but is otherwise untreated. Such an eruption sometimes occurs as an early symptom in smallpox, and during the stage of reaction in cholera; it is also one of the commonest of syphilitic eruptions. But it frequently appears independently of any such disease, and is then usually an indication of some internal source of irritation. It usually subsides in the course of two or three days at most, and causes very little constitutional disturbance. Occasionally it is attended by slight fever and sore throat, and may then be extremely difficult to distinguish from a mild case of scarlet fever. No treatment is usually required, but a mild saline lotion (e.g. a seidlitz powder) may be administered with advantage.

Roses, Wars of, a disastrous dynastic struggle which agitated England during the 15th century, from the first battle of St Albans (1455) to that of Bosworth (1485). It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the Houses of York and Lancaster, whose Lancastrian and Yorkist heralds were respectively a lion and a maison. The Lancastrian claim to the crown came through John of Gaunt, third son of Edward III., created Duke of Lancaster in 1362, having married three years before the heiress of Henry, Duke of Lancaster. On John of Gaunt's death King Richard II. seized his lands, whereupon his son Boing-broke, then in exile, returned to assert his rights, and, finding his cause exceedingly popular, was emboldened to claim the crown, which was granted him by the parliament after the deposition of his cousin. As Edward IV. and Richard III. both died, their brother John became last Earl of March, and he was thus the nearest actual heir to Edward III. through his second son, Lionel, Duke of Clarence. The reigning family had become unpopular from its loss of France and its enemies, and Edward IV. was great in the north, where the power of the Percies was alone rivalled by that of the Nevilles. The Yorkist strength lay chiefly in the mercantile population of the southern counties. The effect of the war was the almost complete destruction of the old nobility, the weakening of the power of the church, and an enormous increase in the power of the crown, together with the great advance of the commercial classes and the large towns, destined a few generations later to measure strength with the crown itself. The first battle of St Albans (1455). A second period of insurrection again gave him the protectorship, but the king recovered his crown. His weakness and the collapse of his pretensions proved his undoing, and in 1460 the Yorkist earls of Salisbury, Warwick, and March defeated and captured the king at Northampton (1460). The Lords now decided to grant the reverie of the crown to York, passing over Prince Edward. The queen refused assent, and fled to Scotland, returning only after the death of York at Wakefield (December 30, 1460); but York's son Edward quickly gained a victory at Mortimer's Cross (1461), though Warwick, who defended the king, was defeated and slain in the body in the second battle of St Albans (1461). But London rallied to young Edward, and in June he was crowned at Westminster after the great victory of Towton (1461). Next year Queen Margaret again appeared in the north, but in 1464 her forces were utterly defeated at Tewkesbury, near Tewkesbury, and the last Yorkist pretender, Prince Edward, died at Hedgeley Moor and Hexham. The estrangement of Warwick and his alliance with Queen Margaret's party drove Edward IV. from England and restored Henry VI. But Edward returned in the spring of 1471, defeated Margaret at Barnet, and at Tewkesbury at the battle of Tewkesbury. The murder of Prince Edward after the battle, and the convenient death of Henry VI. in the Tower, cleared away his two chief dangers and left him to reign in peace. The accession of Henry VII. after
the death of Richard III. on Bosworth field (1485),
his marriage with Elizabeth, daughter of Edward IV.
(1486), and the blending of the red and white rose
in the Tudor badge, marked the termination of the
Wars of the Roses, although the reign of Henry,
whose own title was not good, was from time to time
disturbed by the pretensions of Yorkist impostors.

whether it was established in its own name in 1459.
Paracelsus. Usually the least known of the fifteenth
century magicians were, relatively speaking, less
famous than the Rosicrucians. (Strasburg, 1615); Chymical
Mystery and Hermetic Order of the Rosy Cross, published
in 1817, advertised for the first time the existence of
such an association, which then claimed an antiquity of over 200 years. From subsequent
publications it is inferred that the fraternity
was established in England by a certain Sir
Rosencreutz in 1459. On this point there is no
evidence outside Rosicrucian manifestoes, and all
that concerns the founder is of fabulous or allegori-
ical character. If the society existed as a corporate
body when the Fama Fraternitatis appeared, that
date may be accepted as marking at least the
beginning of its public history. The other docu-
ments which claim to have been issued by the
Rosicrucians are Confessio Fraternitatis R.C.,
addressed to the Learned of Europe (Cassel, 1615); Chymical Marriage of Christian Rosencreutz
Strassburg, 1615); Perfect and True Preparatio
of the Philosophical Stone, according to the Secret
of the Brotherhoods of the Golden and Rosy Cross
(Breslau, 1710); contains the unbridged laws of the
order; and Secret Symbols of the Rosicrucians of
the Sixteenth and Seventeenth Centuries (Altona,
1765–88). These publications, the later part of whose
existence from the original society it is not possible to say,
but it has been supposed that associations in imita-
tion of the fraternity, bearing its name and
emblems, were formed soon after the appearance
of the first manifestoes. By these documents the
Rosicrucians are represented as adepts in Hermetic
mysteries, including metallic transmutation, power
over elemental spirits, and knowledge of magical
signatures—the sigillum rerum of Paracelsus.
They aimed at a general reform in arts and sciences,
especially alchemy and medicine, and passed chiefly
as professors of the healing art. They invited all
students of nature to join them; but, as they gave
no clue to their whereabouts, the manifestoes were
by some regarded as a laborious hoax, an opinion
which does not seem justified by a review of the
entire proclamations. An immense controversy took
place at the time of Germany, whose literary
centres became a battle-ground for rival pam-
phleteers on the merits of Rosicrucian pretensions.
The foremost defenders of the order were Michael
Maier in Germany, Robert Fludd, Thomas Vaughan,
and afterwards John Heydon, in England. Among
its adverse critics were Andrew Libavius, who
afterwards changed his standpoint, and Johann
Valentin Andrae (q.v.). The authorship of the
original manifestoes has, at the same time, been
generally attributed to Andrae, and he certainly
wrote the Chymical Marriage of Christian Rosen-
creutz. The question of the authorship offers a
curious field for investigation, and has exercised
the controversial skill of many ingenious critics;
but no satisfactory solution has ever been reached.
Rosicrucians flourished in France during the period of
the French revolution. They were called to the
lodges in Martinist about 1734; and there are traces of such a fra-
ternity at the beginning of the 19th century both
in England and Germany. A Societia Rosicruciana
in Anglia was formed as an offspring of masonry by
Robert Wentworth Little about 1857, which is to
be distinguished from the peculiar Rosicrucian
Principles of the Rosicrucian Order A.C.A. is a
theological society which has sprung

Rosetta, a town of the Nile delta, on the old
Babittic arm, 9 miles from the Mediterranean and
44 miles by rail NW. of Alexandria which
outripped it. In the time of the Crusades it was
a place of great strength; and St Louis made it the
basis of his crusading operations. Sultan Beyars,
who after that (in 1251) founded the present city further
inland. The Arabs call it Rosett; believing that
Haruna al-Rashid founded the old city.

Rosetta, a circular window with tracery,
such as is shown in our illustrations to the articles
Archives and Glass.

Rosewood. The most valuable rosewood
comes from Brazil. Two kinds, or two qualities, are
known in commerce. These much resemble each
other, the one, which is usually rather the better
figured of the two, coming from Rio de Janeiro,
and the other from Bahia. Although Brazilian
rosewood has been used for making furniture in
Europe for more than two hundred years, the
species of tree or of trees which yield it are not
known to European botanists. Mr Bentham, judg-
ing by the appearance of the wood and of the
leaves of the tree, or of one of those rosewood
trees, has assigned it to the genus Dalbergia. This
view is probably correct. At all events there are three
well-known Indian species of this genus called respectively D. latifolia, D. sissu, and D. cultrata,
all of which, except that they want the dark
blotchy veining, closely resemble the Brazilian
rosewoods. The cellular structure of the wood is
similar in the whole of them. They are all rich in
resinous colouring matter, and all except D. lati-
folia, which is slightly lighter, have a specific
gravity ranging between 0.90 and 1.00, so that
they just float in water. Since at least 1830 the
D. latifolia has been known as East Indian rosewood.
The South American and Indian kinds named above are all hard and
durable, and take a fine polish. They are in every way excellent
furniture woods, the Brazilian kinds being only
more valuable because they are more beautifully figured. Indian rosewood
is chiefly carved by native workmen, and for this purpose it
is well suited. Of late years much of the furniture,
even of a superior kind, made of mahogany in
Great Britain, has been stained of a rosewood
colour. An inferior kind of rosewood is brought from Java and the Dutch.

Rosherville Gardens, "the place to spend a
happy day," were formed near Gravesend by Mr
Rosier, the original proprietor, in worked-out
chalk-quarries. Music, a theatre, a zoological
collection, as well as the pleasant neighbourhood,

Rosicrucians. The mystery which has sur-
rounded this brotherhood of Hermetic philosophers
has afforded a wide field to romantic fiction, and
has much exaggerated their own pretensions. A
German pamphlet, Fama Fraternitatis, or
Mercurian Order of the Rosy Cross, published
in Cassel in 1614, advertised for the first time the existence of
such an association, which then claimed an antiquity of over 200 years. From subsequent
publications it is inferred that the fraternity
was established in its own name in 1459. Whether
Rosenercruzt in 1459. On this point there is no
evidence outside Rosicrucian manifestoes, and all
that concerns the founder is of fabulous or allegori-
ical character. If the society existed as a corporate
body when the Fama Fraternitatis appeared, that
date may be accepted as marking at least the
beginning of its public history. The other docu-
ments which claim to have been issued by the
Rosicrucians are Confessio Fraternitatis R.C.,

Rosmini, a Milotnian village, near the wooded glen of the North Esk, 6½ miles S. of Edinburgh. Its castle, dating from the 14th century, was the seat of the St Clair, Earls of Orkney from 1379 to 1471, and afterwards of Caithness, and hereditary grand Master masons of Scotland from 1435 to 1736. The exquisite 'clapet,' built about 1470, is really the choir of an intended collegiate church, and is only 70 feet long, 35 broad, and 42 high. Its beauty lies not in the outline, but in the projection of stone carving lavished on pinnacles, niches, vaults, roof, and clustered columns, capped and capped on the famous 'Prentice pillar.' The building, essentially Scottish, has often been wrongly ascribed to Spanish, at any rate to foreign, masons. Much damaged by an Edinburgh mob in 1688, it was restored by the third Earl of Rosslyn at a cost of £2000, and has been in use since 1797, as an Episcopal church. On Roslin Moor the Scots are said to have twice defeated the English in one day, 24th February 1303. Pop. 730. See articles by A. Kerr in Proc. Soc. Antiq. Scot. for 1876-78.

Rosmini, ANTONIO ROSMINI-SERBATTI, one of the most original philosophers of the 19th century, was born of noble family at Roveredo in the Italian Tyrol, in 1783. He died a pure and beautiful child, and after a sinless youth of devotion and study decided for the priesthood against his parents' wishes, and began the course at Padua in 1817. Three years later his father's death gave him an ample estate. He was ordained priest in 1821, and devoted the next five years at home with a serene but profound enthusiasm to study, meditation, and prayer. He read widely in philosophy alike ancient and modern, and already revolted within his mind a comprehensive and as it were a supreme system, to serve as a basis for the truths of revelation, while on the practical side he planned a new institution for the training of teachers and priests in wisdom and holiness. From 1826 to 1828 he lived mostly in Milan, next thought out the rule of his new Order in a period of retirement, and severe mortification at Domodossola in the Piedmontese Alps, visited Rome, gained the approval of Pins VIII. both for his special studies and for the institution of his Order, and published his New Essay on the Origin of Ideas (4 vols. 1830), which at once placed his name over the Catholic world. After a few years of labour at Trent, hampered by the jealousies of the Austrian government, which feared his Italian patriotism and his papal sympathies, he settled in 1837 at Stressa on the western shore of Lago Maggiore, and two years later received from Gregory XVI. the formal approval of his Institute. The next few years were the happiest and most fruitful of his life. Surrounded by loved and devoted friends, he sent volume after volume to the press; overpowered by his logic noble opponents to his philosophy like Galvani and Fontana; passed as well as less able writers from the rationalistic and anti-Catholic side, and foiled the restless intrigues of Jesuit enemies, who saw in his enterprise possible dangers to the supremacy of their Order, and brought, according to the Constitution according to Social Justice (1848), was a confederation of the states of Italy under the pope as perpetual president; but his heart sank within him when the pope declared his intention to take no part in the war of liberation against Austria.

For a brief period he backed in the papal favour, and was promised by Pius IX. a cardinal's hat; while for seven weeks he served as the envoy of Piedmont at the papal court, and it was he who the Romans asked for as their Liberal minister in the period before the murder of the much-abused pope's flight to Gaeta. He followed the pope, but now found his mind poisoned against him by the malign suspicions of Antonelli and the reactionary party, and never afterwards regained his confidence. His Constitution and The Five Wounds of Holy Church (1830), ed. by himself, were next prohibited by an irregular meeting of the Congregation of the Index called at Naples. Rosmini submitted without a word of protest, and returned to Stressa to spend the remaining seven years of his life in even more absolute devotion than before to his Institute and to the composition of works intended to complete and consolidate his system of philosophy. His enemies still continued to pursue him with wicked calumnies and charges of heresy in doctrine and unfaithfulness to the Holy See. But when the dignity overhung by its mark, at length the pope, his eyes opened to see how he had wronged Rosmini by his haste, granted him a fair hearing, first enjoining silence on his traducers, and next subjected his whole published works to a careful scrutiny, in relation to the more than three hundred charges brought against them. The process lasted nearly four years (1851-54), but at its close the Congregation of the Index, the pope presiding, declared Rosmini's writings to be entirely free from censure, and enjoined perpetual silence on all without any condition. This was a triumph for which he had waited with sainthood patience, dying at Stressa, not without suspicion of poison, 1st July 1855. It was only in 1888 that Rosmini's restlessly succeeded in getting forty propositions from his posthumous works condemned by the Holy Office.

The Institute of the Brethren of Charity survived its founder, and among the Rosminian Fathers, who are mostly Italians or Englishmen, are to be found at the present day some of the ablest and most devoted among the Rosminians. Its fundamental idea is the principle of passivity, its aim holiness or the moral perfection of the soul. Moral perfection consists in justice or the practical recognition of each being, seen in the idea, according to the beingness that is in it. The elective or contemplative part of the discipline prepares for the assumptive or active part, whose constant aim is the well-being of others. The brethren, who include both clerical and lay members, undergo a two years' novitiate and take the three ordinary vows, but they do no distinctive dress and conform to the laws of the country in which they happen to be. The Institute of Charity was a large-minded attempt to adapt the monastic system and Catholic Christianity generally to the needs of the present day, and its comparative lack of success is only due to the enormous force of interested opposition brought to bear against it by the obscurantist party in the church, whose chief end is despotic power for itself and blind obedience from the people. In England it has foundations at Ratcliffe, Loughborough, Cardiff, Wadhurst, Richmond, and among all the Royal Houses at St Etheldreda's, Holborn, once the domestic chapel of the palace of the Bishops of Ely.

The foundation of Rosmini's philosophy is being considered as the form of the intelligence—an element in mental intelligence composed in himself. He begins by pointing out, as an essential characteristic of cognition, a distinction between the impersonal object known and the personal
subject or known. Human cognitions are intuitions and affirmations, and the former necessarily precede the latter, since they regard things in their possibility, rather than merely formulate assertions as to whether they subsist or do not subsist. Intuitions as possible sensations—i.e., affirmations, things subsistent. Of ideas we may affirm (1) that they are not nothing; (2) that they are not ourselves; (3) that they have a mode of existence of their own, entirely different from that of real or subsistent things, and independent of the bodily senses. The ideas to which the sensations are universality and necessity; for real objects and sensations are always particular, instead of being universal and generic, and every object which involves no contradiction is necessarily possible. These two characteristics involve two others, infinity and eternity; the origin of the idea comes from God, for man does not receive them from the things themselves. The one 

determine and wholly universal idea is that of being or existence; we cannot determine the subsistence of an object until we have the idea of it, therefore per-
certain ideas which by another isolation from all the other elements of the perception by the process of universalisation, through which it may be realised an indefinite number of times. When the ideas are all fully or perfectly determined, they are called concrete; when they remain to a certain extent, they are abstract. The dimensions of the ideas are sensations; these are merely the occasions of its discovery by the intelligence, which can admit that to be possible which the sensation represents as real. By the process of universalisation they form those ideas which are completely determined; by those which are determined only to a certain extent. It is this idea of being which makes intelligence possible; it is the necessary form of human reason, the indispensable condition given by nature herself, the parts of which generate all others. It is cognisable by itself, as otherwise there is nothing else that could make it known; the idea of being gives itself the essence of the thing. Herein is secured the objectivity of truth—the faculty of recognising the essence of things, the foundation of the Absolute, a result of the internal consciousness of man, the logical foundation on which faith and charity may be supernaturally built. Being is incorporeal, independent of space, spiritual, and therefore incorruptible and immortal. It is independent of time; as being in its essence is always being, and as it would be a contradiction in terms for being to cease to be, it is eternal. But since it was united to the soul in time, it must have existed before it, and be independent of it. And thus we reach an Intelligence anterior to human intelligence—an Eternal Mind. This eternal mind is God's, and therefore God exists, and his existence and the immortality of the soul remain the true foundation of morals. But being as intuitively seen by nature merely gives the certainty that God exists; it cannot make God known to us until we are illuminated by a new faculty—an idea of light, the Light of Grace. Thus a necessary place for revelation is found in the essential limitations of man's nature, and this revelation of God is contained in the Gospel of Jesus Christ, which alone can harmonise all the contradictions of the universe.

Rossini's most important work was his contribution to Ideality; his masterpiece is his New Essay on the Origin of Ideality (1828); Eng. trans. 3 vols. (1828-49); and his Psychology (1846-48); Eng. trans. 3 vols. (1848-88), both of which belong to the classics of philosophical literature. Death overtook him before he had completed his great projected work, the Thesagogy (5 vols. 1839-74). A complete Bibliography of his writings, ninety

nine in number, is prefixed by Thomas Davidson to his admirable translation (1882) of the Sistema Filosofico (1845), grouped under the heads of Ideology and Logic, Metaphysical Sciences, Philosophy of Morals and Right, Intuition and Apportionment, Science of Architecture, Ideality, Philosophy of the Supernatural, Ecclesiastical Prose, and Miscellaneous. The last section includes two volumes of Correspondence, as well as a large number of Letters to various friends, besides a brief Life and a Lucid Introduction, a list of books relating to Rossini's Life and Philosophy. Here we may name the studies by Tommaso (Turin, 1856), Franco, Paoli (Turin and Rome, 1846), and the Studies of Lockhart (2d ed. complete, 2 vols. 1886). Rossini's own Sketch of Modern Philosophers and of his Own System has been translated, with an admirable Introduction, by Esther L. L. Tuke (1882).

Rosoglio, a variety of lichen, made in Italy, and flavoured with flowers or fruits, especially orange blossoms.

Ross, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Dunrossness, Montrose, Roxburgh, Ardressan.

Ross, a market-town in Herefordshire, is finely situated on the bank of the River Wye, 5 miles of Hereford. In the parish church (1816), whose 'heaven-directed spire' is 208 feet high, is buried John Kyre (q.v.), celebrated by Pope as the Man of Ross. The town carries on a trade in cider, malt, and wool, has corn-mills and tanneries, and is much visited by tourists. Pop. (1881) 5724; (1891) 5725.

Ross, Sir John, Arctic voyager, born June 24, 1777, was a son of the minister of Inch, Wigtownshire, and was little more than nine years old when he entered the navy, serving with distinction in the French wars. His most important services were rendered in the Arctic regions, whither in 1818 he proceeded with Parry as his second in command; the objects of the expedition were to explore Baffin Bay and attempt a North-west Passage. Ross published the results of his investigations in A Voyage of Discovery (1819). In May 1829 he commanded a fresh expedition to the Arctic regions, with Sir Felix Booth, and discovered the peninsula of 'Boothia Felix.' Ross received, on his return in 1833, the honour of knighthood. The results of this expedition were written down in Narrative of a Second Voyage in Search of a North-west Passage (1835). He made yet another voyage to the Polar regions—his last successful attempt to find Sir John Franklin, in 1850. Ross wrote Memoirs and Correspondence of Admiral Lord de Saumarez (2 vols. 1838), a Treatise on Navigation by Steam (1838), and other works. He died in London, August 30, 1866.

Ross, Sir James Clark Ross, his nephew, also distinguished himself as an Arctic navigator. He was born in London, April 15, 1800, entered the navy in his twelfth year, accompanied Sir John in his first and second Polar voyages, and in the interval between visited the same regions with Parry in his expeditions. He discovered in 1831 the North magnetic pole, and on his return was rewarded with a post-captaincy. After being employed by the Admiralty in a magnetic survey of Great Britain and Ireland, he was placed in command of the Erebus and Terror for an expedition to the Antarctic seas—his first attempt and approach to the South magnetic pole. He was knighted after his return home in 1843; and in 1847 published Voyage of Discovery in Southern Regions, 1839-43 (2 vols. 1847). In 1848 he made a voyage in the Enterprise to Baffin Bay in search of Sir John Franklin. He died at Aylesbury, April 3, 1862. See Mackinder, Ross and the Antarctic (1892).
Rossall College, a large public school on the coast of Lancashire, 24 miles SSW. of Fleetwood, was founded 1815 by the intervention of the sons of clergymen and others. It has two entrance scholarships, thirty masters, and over 330 boys. See the Jubilee Sketch by Canon Beechey (1894).

Ross and Cromarty, a Highland county, the third largest in Scotland, extends from the German Ocean to the Atlantic, and is bounded 30 miles on the south by Sutherland. In 1890-91 it was finally formed into a single county by the boundary commissioners, who also added to it the small Ferintosh (detached) district of Nairnshire, and a much smaller fragment from Inverness-shire. Its mainland portion measures 75 by 67 miles, and the total area is 2,084,900 acres or 3,260 sq. m., of which 103 are water and 736 belong to a dozen islands—the Lewis, Tanera, Ewe, &c. The east coast is indented by the Dornoch, Cromarty, and Moray Firths; the west coast by eight sea-locks (Brochel, Torridon, Carron, &c.).

The chief of the innumerable streams are the Oykel, Ainess, and Conan; the Falls of Glomach, on a head-water of the Elchaig, in the SW. are 370 feet high; and beautiful Loch Maree is the largest of nearly a hundred good-sized fresh-water lakes. Mount Sallhall (3802 feet), on the Inverness-shire border, is the highest of more than thirty summits exceeding 3200 feet above sea-level, others being Ben Dearg (3547), Benmore (3506), Ben Wyvis (3429), and Ben Attow (3383). The high grounds afford good pasture, and systematic sheep-farming dates from about 1784. It reached its zenith during 1860-70, when 400,000 sheep were grazed in the county. The glens and low grounds in the more favoured portions have a fertile soil, which, with the fine climate, especially in Easter Ross, bears crops of superior quality. Still, more than 7 per cent. of the entire area is arable, and less than 70 square miles is occupied by woods and plantations. Whisky is distilled, and the salmon and sea fisheries are very valuable. Montrose was defeated at Invercharron (1650), and a small Jacobite force, under Lord Glengall (1718). Sir Thomas Urquhart, Lord Lovat, and Hugh Miller were natives. The chief places are Dingwall, Tain, Stornoway, Fortrose, Cromarty, Strathpeffer, and Invergordon; and the county returns one member to Parliament. (1801) 56,318; (1831) 92,707; (1851) 78,547; (1861) 77,510.

Rossbach, a village in Prussian Saxony, 22 miles W. by S. of Leipzig and 9 SW. of Merseburg, is celebrated for the victory gained here by the Prussians under Frederick the Great (q.v.) over the combined French and Austrian armies on 5th November 1757. The 'runt of Rossbach' remained for a long time a term of reproach in the French army. The Prussians lost 540 killed and wounded, while the allies lost more than 2700 killed and wounded and 5000 prisoners, among whom were 5 generals and 300 officers, and nearly 70 cannon.

Rosco, William Parsons, third Earl of, an astronomer, was born in York on 17th June 1800, and educated at Trinity College, Dublin, and Magdalene College, Cambridge, where he was placed first in the class in Mathematics in 1822. During the life of his father he sat in the House of Commons as Lord Oxmanton, representing King's County from 1821 to 1834; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1852. He had commenced to make experiments in the construction of field lenses; but he subsequently devoted his powers to the construction of a speculum for the reflecting telescope. Certain defects had hitherto baffled opticians—namely, spherical aberration and absorption of light by the glass; and our casting specula of large size cracked and warping of the surface on cooling; but Lord Rosse succeeded in obviating the last defect, and in counteracting in great part the other two. He began the construction of a great reflecting telescope in 1845; it weighed in all 12 tons, and was mounted in his park at Parsonstown at a cost of £30,000. The first addition to astronomical knowledge made by this telescope was the resolution of certain nebulae into groups of stars; next came the discovery of a number of double stars, and some of the most luminous are now known to exist. The telescope is described in the Philosophical Transactions, in which journal, and in the Transactions of the Royal Society, Dublin, most of his papers were published. Lord Rosse was president of the Royal Society from 1854 to 1861. He died on 31st October 1857, and a statue to his memory was erected in Parsonstown in 1876.

Rossett, an electoral division of north-east Lancashire, in which is Haslingden (q.v.).

Rossetti, Gabriele, an Italian poet and man of letters, particularly concerned in Dantean criticism, was born on 28th February 1783 at Vasto, in Abruzzi Citeriore, then forming part of the kingdom of Naples. His father, Nicola Rossetti, was engaged in the iron-trade of the district; his mother was Maria Francesca Pietrocola. The parents were not in easy circumstances, and had a large family: besides Gabriele, two of the sons attained some eminence, Andrea becoming a canon in the church of Naples, and Domenico being well reputed in letters and antiquities. Gabriele was imbued with notions of more than common ability, and was placed by the local grandee, the Marchese del Vasto, to study in the university of Naples. He had a fine tenor voice, and was sometimes urged to try his success on the operatic stage; he drew with such precision that some of his extant pen-drawings with sepia-ink might readily be taken for steel-engravings; he composed poetry, both written and improvised, and became one of the most noted improvisatori in Naples. The boyhood and youth of Rossetti passed in a period of great political commotion, in which the revolutionary and imperial wars of France. The Bourbon king of Naples, Ferdinand I., was overthrown by the Parthenopean Republic, and again by King Joseph, the brother of Napoleon, and his successor King Joachim (Murat), the emperor's brother-in-law, and Ferdinand had to retire to Sicily. Rossetti obtained an appointment as Curator of Ancient Bronzes in the Museum of Naples, and also as librettist to the operatic theatre of San Carlo: he wrote the libretto of an opera, Giusto Sabino, well received at the court of the Napoleonic sovereigns, and in 1813 acted as a member of the provisional government sent to Rome by Murat. After the restoration of Ferdinand to Naples in 1815 he continued his connection with liberal politicians, and joined the widely-diffused secret society of the Carbonari. In 1820 a military uprising compelled King Ferdinand to grant a constitution on the model of that which had recently been established in Spain. Rossetti saluted its advent in the following imperfect couplet:

Sei pur bella ogli astri sul erme
('Beautiful indeed art thou, with the stars in thine hair').

The good faith of the king was highly dubious from the first, and in 1821 he abrogated the constitution, and put it down with the aid of Austrian troops. Rossetti had been described and persecuted, Rossetti among them. Two verses in one of his lyrics are said to have given...
especial offence to the king—'Ché i Sandi ed i Laveli! Non sono morti ancor!' ('For Sandi and Laveli are not yet dead, the association of Kotskebne and of the Due de Berri'). Rossetti had to escape from Naples with the kindly connivance of the British admiral, Sir Graham Moore, who shipped him off to Malta in disguise of a British naval officer. In Malta he was: soon afterwards he was elected professor of Italian in King's College, London. They had four children: (1) Maria Francesca, born 1827, died 1876 (author of A Shadow of Dante, &c.); (2) Gabriel Charles Dante (see below); (3) William Michael, born 1829 (political writer, and editor of Shelley); (4) Christina Georgina (see below). In London Rossetti lived a studious, laborious, and honourable life, greatly respected by his pupils, and by Italian residents and visitors; he was a man of strong and steady affections and vivacious temper, and still adhered to all his pursuits. In politics he was a vigorous liberal, but more inclined to a constitutional monarchy than a republic; in religion he was mainly a freethinker, but tending in his later years towards an undogmatic form of Christianity. Though totally opposed to the Roman Catholic church, and a man open to all attacks of a paralytic character he died in Albany Street, off Tottenham Court Road, on April 28, 1849. Besides some poems published in Italy, Rossetti produced the following works: Dante, Commedia (the Inferno only was published), with a commentary aiming to show that the poem is chiefly political and antipapal in its inner meaning (1826); Lo Spirito Antipapale che produce la Reformation (The Anti-papal spirit which produced the Reformation)—an English translation also was published), reinforcing and greatly extending the same general views (1832); Idolo e l'Uomo, Satirico ('God and Man, a Satyr'), poems (1832); Il Mistero dell'Amor Paterno ('The Holy of the Heavenly Love of the Middle Ages'), 5 vols., a book of daring and subtle speculation tending to develop the analogy between many illustrious writers as forming a secret society of anti-Catholic thought, and the doctrines of Gnosticism and freemasonry (1840); this book was printed and prepared for publication, but withheld as likely to be deemed rash and subversive; La Beatrice di Dante, contending that Dante's Beatrice was a symbolic personage, not a real woman (1842); Il Veggente in Sotududine ('The Seer in Solitude'), a speculative and partly autobiographical poem in one hundred and forty-nine verses, though clandestinely, in Italy, and a medal of Rossetti was struck there in commemoration; Versi (miscellaneous poems), 1847; L'Arpa Evangelica ('The Evangelic Harp'), religious poems (1848); Rossetti regarding Dante, along with Petrarca and Boccaccio, as one of the Italian authors, excites a great deal of controversy, which still continues in various forms and with varying fortunes. His memory is much revered in his native place, where the house of his birth has been bought by the local council and converted into a museum, and the chief square has been named after him.

DANTE GABRIEL ROSSETTI (or properly Gabriel Charles Dante), elder son of the foregoing, was born in Charlotte Street, Portland Place, London, on 12th May 1828. He was educated in King's College School, London; but, having from his earliest years evinced a wish to become a painter, he was later taught by his intimate friend, the sculptor Thomas Woolner; and his first chief instructor was John Everett Millais and William Holman Hunt, and the sculptor Thomas Woolner; and with these three he founded the so-called Pre-Raphaelite Brotherhood. This was completed by the addition of three other members. The chief incentive to the foundation of this society, and of the school of art which it initiated, was the distaste and disrespect felt by the youthful artists for the poverty-stricken conceptions and vulgar excesses in which most of them were reared in early life, and which are still current in England, mingled with a sincere and reverent delight in those qualities of genuine and spontaneous invention, lofty feeling, and patient handicraft, which had been developed by the European schools of art preceding the culmination of Raphael and his followers. A natural result of this frame of mind was a disposition to realise objective details to the utmost, with a view to the thorough authenticity of the visible means through which ideas are conveyed; but it was a mistake to make the rules of science the guide of all in art; exactness and sometimes a plethora of details, to suppose that the main concern of the associated artists was really with the details, and not with the ideas. The English Pre-Raphaelites wished to exhibit true and high ideals through the medium of true and right idealised details. Two further mistakes have been frequently repeated concerning these artists; first, that they were an offshoot of the 'Tractarian' movement, guided by religious pietism; and second, that they were set going by Mr Ruskin. Rossetti's earliest oil-picture, exhibited in 1849, was 'The Girlhood of Mary Virgin,' his next (1850), now in the National Gallery, 'The Annunciation.' After this he withdrew from exhibiting almost entirely, and his art developed through other phases, in which the sense of human beauty, intensity of abstract expression, and richness of colour were leading elements. He produced innumerable water-colours of a legendary or romantic cast, several of them being from the poems of Dante, others from the Arthurian tradition. Among his principal oil-pictures are the Triptych for Llandaff Cathedral, of the 'Infant Christ adored by a Sun-bright Shepherd and a Dove, set amongst the Elements of the Canticles,' 'Dante's Dream' (now in the Walker Gallery, Liverpool), 'Beata Beatrix' (National Gallery), 'Pandora,' 'Preserpine,' 'The Blessed Damozel' (from one of his own poems), 'The Roman Widow,' 'La Ghirlandata,' 'Venus Astriae,' 'The Day-dream.' He designed several large compositions, such as the 'Magdalene at the door of Simon the Pharisee,' 'Giotto Painting Dante's Portrait,' 'Cassandra,' and the 'Boat of Love' (from a sonnet by Dante); but these failed to carry out as pictures on an adequate scale, partly owing to the fact that he was then overburdened with commissions, and he was forced to execute smaller works, consisting mostly of female half-figures ideal in invention or feeling, and executed in life-size. The early studies of Rossetti in art had not been so steady or systematic as might have been wished. Afterwards, beginning in Paris, he became a great student of history, and won the friendly training from his constant intimate, Mr Ford Madox Brown, the historical painter; but, notwithstanding his passionate impulse as an inventive artist, and his impressive realisation of beauty in art, he never developed those short comings in severe draughtsmanship and in technical method, and some degree of mannerism in form and treatment, have often, and not unjustly, been laid to his charge. Rossetti began writing poetry about the same time that he took definitely to the
study of painting. Besides some juvenile work, and some translations from the German (that of Henry the Loper, by the medieval poet, Hartmann von der Aue, is preserved), he executed a number of translations from Dante and other Italians, published in 1861 as The Early Italian Poets, and again in 1874 as Dante and his Circle. Two of his best-known original poems, The Portrait and The Ballads, were written in his nineteenth year, and many others followed. These were about to be published in 1862 in a volume (some of them having been previously printed in magazines—chiefly in The Germ, 1830, and The Oxford and Cambridge Magazine, 1836), but a domestic calamity and ill health prevented publication, and it was set aside for some years. Rossetti had fallen in love towards 1851 with a very beautiful girl, a dressmaker’s assistant, named Elizabeth Eleanor Siddal; he married her in 1859, but she died suddenly in February 1862. In the first impulse of desolation he buried his MSS. in her coffin. In 1869 he thought fit to recover them, and in 1870 he issued his volume named Poems, containing the bulk of those compositions and several others written not long before the date of publication. The poems were received with great eagerness, and was reviewed with great admiration and even enthusiasm by some leading critics. Late in 1871, however, Mr Robert Buchanan, writing in the Contemporary Review under the pseudonym of Thomas Maltrith, attacked the book on literary, and more especially on moral, grounds; and soon afterwards he republished his article, The Fleshly School of Poetry, as a pamphlet. Rossetti was now in a depressed state of health, suffering much from insomnia, from an abuse of alcohol as a palliative, and from the constant care (he often thought he would become blind, as his father had very nearly been). The literary detraction, conspiring with physical malady, produced a strong and exaggerated effect upon him; and from about the middle of 1872 he became morbidly sensitive and gloomy, and very reclusive in his habits of life, though his naturally strong sense, and his turn of mind, in which a good deal of humour and practicality was blended with idealism, continued to form a substantial counterbalance. In 1881 he published a second volume of poems entitled Ballads and Sonnets, a collection of some of his finest work, Rose Mary, ‘The White Ship,’ ‘The King’s Tragedy,’ and the completed sonnet-sequence, ‘The House of Life’), and at the same time he re-issued, with some omissions and interpolations, the Poems of 1857—1870, his second volume being by this time extremely shatted. A touch of paralysis afflicted him towards the end of 1881, and, rotting in the hope of some improvement to Birchington-on-Sea, near Margate, he died there of pneumonia on 9th April 1882. The poetry of Rossetti is intense in feeling, exulted in tone, highly individual in personal gift, picturesque and sometimes pictorial in treatment, and elaborately wrought in literary form. These characteristics are sometimes made consistent with simplicity, but more generally with subtilty, of emotion or of thought. As in his painting, there is a strong medieval tendency. It is not generally allowed that Mr Buchanan’s charges of immorality against the writings were wide of the mark; indeed, he himself has admitted and proclaimed as much. Rossetti was intimate at one or other period with many of the most poetical men of the day. In politics he took no part. His religious views were vague—at times negative enough; but he had a strong sense of reverence, and a tendency to superstition rather than distinct faith. In person he was of middling height, with a handsome, expressive physiognomy, more Italian than English. His portrait, a pencil-drawing executed by himself towards the age of eighteen, is in the National Portrait Gallery. He was generous, untrite, warm-hearted, not discursive, not habituated to the natural and unaffected manner, concentrated in aims and modes of work. In almost all companies in which he mixed he assumed and preserved a marked ascendency, due to his exceptional faculty and uncompromising tone of mind and character.

CHRISTIN GEORGINA, the younger daughter of Gabriele and Frances Rossetti, was born in Charlotte Street, Portland Place, London, on 5th December 1830. She was brought up entirely at home under her mother’s tuition, as a member of the Anglican Church. She was a writing verse in early girlhood. Before she was seventeen a little volume of her poetry was privately printed by her maternal grandfather, Gaetano Poldi, who kept a printing-press for his own convenience at his residence in London. Her publications are Goblin-Market and other Poems (1862), The Prince’s Progress and other Poems (1866), Sing-song (1872), A Pageant and other Poems (1881); and, in prose, Commonplace and other Stories (1870). Speaking Likenesses (1874), and Tales from Byron (1882). In 1891, Miss Rossetti, whose health was weak, died 29th December 1894. She had lived a very secluded life, divided between devoted attention to her mother (who died at a very advanced age in 1886), and earnest religious thought and practice. In direct poetical gift it is not of a high order of poetry. She may have been as finely equal to her brother Dante Gabriel, although the outcome is of a less conspicuous kind. Her poems have a singular degree of grace, delicacy, and spontaneity, deep in feeling, sensitive and certain in touch, and marked by great purity of emotional thought, and by an unfailing instinct of style. Several of her lyrics have been set to music, and cantatas for two of the longer poems—Goblin-Market and Songs in a Cornfield—were composed by Agilea and Macfarren. See her Life by Mackenzie Bell (1899).

As to Gabriele Rossetti, various critical articles regarding him, more especially discussing getting his laws concerning Dante, &c., will be found in contemporary periodicals, and in some volumes: the work of Arons, entitled Dante, and Dante, Adante, et Societatis (1854), is founded chiefly on Rossetti’s researches, which he presents in an exaggerated form. As to Dante Gabriel Rossetti, see William Sharp, Dante Gabriel Rossetti, a Record and Study (1882); Hall Caine, Recollections (1882); Joseph Knight, Life of Dante Gabriel Rossetti (1887; ‘Great Writers’ series); William Rossetti, Dante Gabriel Rossetti as Designer and Writer (1899); the article by Theodore Watts in the Encyclopaedia Britannica; the monograph in the Portfolio by F. G. Stephens (1894); and the Memoir and Family Letters (2 vols. 1895) by his brother William Michael (born 1829), author of the above article, who has also published the following books: Dante’s Comedy, the Heli, blank verse translation (1865); Fine Art, chiefly contemporary (1867); Lives of Famous Poets (1878); Life of John Keats (1887); Shelley’s The Fortunate Franklin (Clemens Press, 1891); annotated editions of Shelley and of Dante Gabriel Rossetti (2 vols. 1886), and other writings.

Rossi, pellelorino, was born of a noble family at Carrara, 13th July 1787. He studied at Bologna, and was made professor of Law there at twenty-five. Exiled after the fall of Murat, he obtained a chair at the Sorbonne, and was author of his Traité de Droit Pénal. In 1833 Louis-Philippe called him to Paris, and appointed him professor of Political
Economy at the Collège de France. For his Cour d'E ducatino dionnel (1836) he was naturalised and made a member of the Chamber of Peers. He was sent also to Russia as ambassador in 1845, and there witnessed all the events of 1848, having tiged to become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX, Rossini strove to oppose the party favourable to the House of Savoy, and devised an alliance with Naples, his object being a confederacy of Italian princes with the pope as paramount. This roused the hatred of the Romans, and Rossini was stabbed to death by an unknown hand on the 15th November 1848.

Rossini, Gioacchino Antonio, Italian operatic composer, was born at Pesaro, on the Adriatic, February 29, 1792, and was the only child of Giuseppe Rossini, town trumpeter and inspector of slaughter-houses, from whom he inherited his brightness and humour. From the age of seven he studied music and singing at Bologna under various masters, till in 1807, after having appeared as conductor of the local Academia dei Concordi, he entered the Bologna Liceo, or conservatorium. He soon became known in neighbouring towns as accompanist at the theatres, travelling along with his father, now a horn-player. Numerous operatic works, mostly successful, were written for the Bologna Liceo, the opera of 1812, La Pietra di Pacagnone made a great impression, and gained the composer exemption from the French conscription. Next year Turandot, at Venice, created the wildest excitement, which soon spread over Italy. After producing several other works, now mostly forgotten, he was appointed musical director of the San Carlo and Del Fondo theatres at Naples. On February 5, 1816, he brought out at the Argentino theatre in Rome II Barbieri di Siviglia, founded on Beaumarchais' play, and written in thirteen days. From the predilection of the Romans for the aged Paisiello, who had written an opera on the same play, and from a series of ludicrous accidents, it resulted on the first night in a complete fiasco; but next night, after the first act had been fairly heard, the public found the enthusiasm proceeds Concondi, who became Rossini's house, and conducted him to the theatre in triumph; and its popularity increased with each succeeding representation. Of all his works it has the prospect of most lasting vitality, and in its complete accord with the libretto is the most perfect as a whole. Observed in it is the marked advancement in the style of serious opera, but was not at first successful; the tragedy was too sombre. The comic Cenerentola, in 1817, was favourably received in Rome, and immediately thereafter La Gazza Ladra obtained a triumph at Milan. These were rapidly followed at Naples by Armida and Mosè in Egitto (1818), la Donna del Lago (1819), and Mosè in Egitto (1820). In 1821 he married Isabella Colbran, who had sung frequently in his opera, and the two proceeded to Vienna, where his innovative personality carried all before him, in spite of the venetian bitter opposition. After his return to Bologna, Semiramide was written in 1823 for the Fenice Theatre, Venice; but though, or greatest, or at least the most advanced, of his Italian works, it had only a lukewarm reception. It was the Venetians, invited to London, he and his wife on their way thither paid their first visit to Paris, where he had so cordial a reception that he resolved to return. In England he was welcomed with the greatest favour by the king and the aristocracy, but received no new work, though much was said of an opera intended for the King's Theatre.

On his return to Paris he entered on the duties of director of the Théâtre Italian for eighteen months; and, though not exactly the man for such a post, he had the credit of engaging several famous singers, and produced some of his already written operas, as well as many that were new, including The Barber of Seville, which was produced at the English Court. On August 3, 1829, his greatest work, Guillaume Tell, conceived and written in a style entirely different from and superior to that of his Italian operas, and more nearly conforming to modern dramatic ideas. Its success was immediate and immense, but, chiefly, owing to the wretched libretto, not lasting. From this period till his death his pen was scarcely more than once again resumed; except a few trifles, its only product was the Stabat Mater, first given in 1841, highly attractive and always popular, but little in keeping with the majestic sadness of the subject. After the decision, in his favour, of a tedious lawsuit, he retired in 1836 to Bologna, to comfort the last years of his father, and to bestow the utmost care on the Liceo, which he raised to a high position as a school of music. His wife died in 1845, and in 1847, after he had married again, for the last time, Rossini went to Florence. In 1855 he returned to Paris, and in his villa at Passy became one of the most noted and personalities of the capital. He died there, November 13, 1868. He stands at the head of Italian composers for the stage, though Verdi now far outstrips him in popularity and greater dramatic force and passion, and though only a few of his operas still hold the field—above all, the Barber, Semiramide, and William Tell. His early works would now sound strangely old-fashioned, but he led the way in reform and progress, from ideas. While all his improvements had been elsewhere anticipated by Mozart, and some of his devices were very transparent and soon became hackneyed, the taste of the audiences for whom he wrote must not be forgotten in estimating his work. In his years of old age, he showed an inexhaustible facility in creating melodies which at once delighted the ear—an unequitable possession, the first requisite of a great composer; and though he did not use all the means available in his art, the splendid results he obtained are perhaps on that account more marked.

See the biography by H. S. Edwards (1859), the same author's shorter Life in the "Great Musicians" series (1881), and the more extensive French work of M. Arvedo (1865). There are also works on Rossini by Montrond, Zandonini (1870), and Sittard (1882).

Ross-shire. See Ross and Cromarty.

Roster (corrupted from Register) is a list of individuals or corps, kept by officers of the army to ensure the allotment of duties in proper rotation. Thus officers are detailed in turn for guard, court-martial, or other duties, according to the district, garrison, or regimental roster. Regiments, battalions, and batteries take their turn of foreign service according to the adjutant-general's roster.

Rostock, the most important town of Mecklenburg-Schwerin, and one of the busiest ports on the Baltic, stands on the Warnow, 7 miles from its mouth and 60 miles by rail N.E. of Schwerin. It consists of the city proper, surrounded by promenades on the island of Rostock, and the suburbs which have grown up beyond them. It has busy fairs for wool, horses, and cattle; imports coal, wine, herring, petroleum, groceries, timber,
&c.; exports grain, wool, flax, and cattle; owns a mercantile fleet of 750 vessels of some 150,000 tons, and is entered annually by more than 900 vessels of about 120,000 tons. Vessels above 200 tons unload in part at Warnemünde, at the mouth of the river. The industries are very varied, the most important being shipbuilding, the making of machinery, tanning, brewing, distilling, the manufacture of hats, tobacco, &c. The university, founded in 1418, but rebuilt in 1867, is the chief of the public institutions; it has 40 teachers, 300 students, a library of 140,000 volumes, an observatory, and an experimental agricultural colony. Amongst the churches are St Mary's (1398-1472), one of the finest Gothic churches of north Germany, in which is a monument of Grotius, and St Peter's, with a tower 414 feet high. The ducal palace (1702) and the 14th-century Gothic town-hall also deserve mention. There is a handsome public park. The statue of Blicher, a native of the town, adorns one of the squares. Pop. (1875) 34,172; (1890) 44,388. Rostock, an ancient Slav town, was burned to the ground by Walthemar of Denmark in 1525. Among other things, it is known to posterity by the fact that this time it enjoyed great repute as a powerful member of the Hanseatic League, and secured important rights of self-government. It still possesses a thoroughly republican municipal constitution, and forms a separate estate in the Mecklenburg Assembly. See history by Köppmann (Rostock, 1887).

Rostoff, (1) a town of south Russia, stands at the head of the delta of the Don and on the railway (1875) from Moscow to the Caucasus. It owes its origin to the foundation of a fortress here in 1761, since when the progress of the town, owing to its advantageous situation, has been remarkable. Pop. (1881) 44,500; (1885) 61,256. It exports corn, linen, and wool to the value of £3,000,000 a year; its imports only reach £30,000. The manufactures are growing rapidly; the principal articles produced being ropes, tobacco, macaroni, soap, and leather; but here are also shipbuilding-yards, wool-cleaning establishments, and caviare-factories. Two important fairs are held here every year.—(2) One of the oldest towns of Russia, stands on a small lake, 120 miles by rail from Moscow, and possesses marbled gardens, a large fair, an extensive trade, tallow-works, and coarse linen manufactures. Pop. 11,998.

Rostopchine, FEODOR VASSILIEVICH, COUNT, a Russian general, was born in the government of Orel, March 23, 1783, and entered the Russian military service as a lieutenant in the Imperial Guard. He won great influence over the weak mind of the Emperor Paul, who promoted him to various offices in rapid succession. In May 1812 the Emperor Alexander appointed him governor of Moscow. He it was, according to the French writers, who plotted and began with his own hand the burning of Moscow. But in 1823 he published La Vérité sur l'Incendie de Moscou (Paris, 1823), in which he rebuts the charge, affirming that this action was due in part to a few of the inhabitants, and in part to the violence and negligence of the French. He was summarily called to answer for this, and not unusually called this denial and admitted his share in the burning, in that he at least set fire to his own mansion-house. He died at Moscow, January 30, 1826. His works, which include a number of historical memoirs, two comedies, and a Russian translation of Molière, was published at St Petersburg in 1853. See life by Schnitzler (Paris, 1863) and by Séguir (Paris, 1872).

Roswitha, or Hrotswita. See DRAMA, Vol. IV, p. 83.

Rot. See Fluke, Dry Rot.

Rotation. When all points of a body are moving with the same velocity (q.v.) the motion is one of pure translation, and is easy to comprehend. When, however, this condition is not fulfilled there must exist the kind of motion known as rotation. As simple examples, take the whirl of a flywheel or the motion of the hands of a watch. In such cases we readily see that there is, in the rotating body, a row of points which does not itself move. This row of points is called the axis of rotation, and every other point in the body describes a circle about it. To specify the motion completely we know not only the position of this axis, but also the rate of rotation and the sense, clockwise or counterclockwise, with which the body is rotating about the axis. The rate of rotation may be measured by the number of revolutions made in a chosen time. It is more scientific, however, to measure it in terms of the angular speed. If the body is rotating uniformly the angular speed is the angle described in unit time by any plane drawn in the body parallel to or containing the axis of rotation; e.g. with the sidereal day, the earth's angular speed about its axis is 2t or 360°; but with the second as the unit of time the angular speed is a quarter of a minute of arc, or 000073 in radians.

In a simple geometric way a given rotation may be represented by a directed line taken of length numerically equal to the angular speed, and drawn along the axis of rotation in that direction which is related to the sense of rotation exactly as the to-and-fro motion of a right-handed screw is to the rotational motion of the screw. Such a directed quantity of definite length and of definite line position is called by Clifford a rotor. It is a Vector (q.v.) under the restriction that its lie in space is limited to a particular straight line.

So long as the axis of rotation is fixed with reference to lines which appear steady to us, there is no difficulty in apprehending the character of the motion. Take, however, the case of a carriage wheel or boy's hoop rolling along the road. Here we may regard the wheel as rotating about an axis drawn through the centre, while the axis is at the same time moving forward with a definite linear speed—in, i.e. we may regard the motion as a combination of translation and rotation. In this particular case we may, however, represent the motion at each instant as one of pure rotation about an axis coinciding with the line of contact of the wheel with the road. For, with rolling and no slipping, this line of contact with the road is for the moment at rest. And it is almost self-evident that, if at any instant there exists in right connection with a moving body an axis momentarily at rest, the instantaneous motion must be of the character of a rotation about this axis. The above is a simple example of what holds generally in uniplanar motion—i.e. motion in which every point of the body moves in a plane perpendicular to the fixed axis. The general theorem is that any uniplanar displacement whatever (which is not a pure translation) can be effected by a pure rotation about a determinate axis. Since any given motion may be regarded as consisting of a succession of displacements, it follows that any such uniplanar motion can be effected by a succession of rotations about instantaneous axes whose successive positions in space and in the body are determinate.

In uniplanar motions generally it is clear that the instantaneous motion, however much it may move both in space and in the body, must always remain parallel to the same direction. If discontinuous motion be excluded—and all natural motions are continuous—this instantaneous axis
will pass continuously from position to position. It will trace along one or more surfaces, real or imagined, one in the body; and at any given instant these surfaces will touch along the line which is for the moment the instantaneous axis. It is not difficult to show that the complete motion of the body may be represented by the rolling of one of these surfaces upon the other. In the simple case of the carriage wheel the rolling surfaces are evidently the circumference of the wheel and the plane of the road. These theorems in uniplanar motion have many interesting applications in the kinematics of machinery (see Minchin's Uniplanar and Conical Rotation, Longmans, Green Press).

If the motion is not uniplanar it is no longer possible in general to represent it by a succession of pure rotations. There is, however, a very remarkable theorem, which can be proved without difficulty, but which is hard of apprehension and even of acceptance. It is that after any displacement whatever of a body in space there is, in the body or rigidly connected with it, a line of points which is simply shifted along its own line in space. The whole displacement may then be effected by means of a sliding along this line. In other words, by a definite screw motion with reference to this line as axis (see Screw). Even in the simpler case, when by fixing one point of a body we quite exclude translation, it is not easy to grasp the significance of the fact that after any displacement whatever of a body there is a line of points which occupy exactly the same positions as before the displacement. From this theorem it follows that, however such a body may be moving, there is momentarily a line which is at rest. This line is the instantaneous axis of rotation. It always passes through the point of support, and will as it shifts in time describe two conical surfaces, one in space and the other in the body. Any given continuous motion can then be effected by the rolling of one determined conical surface fixed in the body upon another fixed in space.

As an ordinary spinning-top. Here to the eye there is in general a rotation of the top about its axis of figure, while at the same time the top executes a conical motion about a vertical line through the point of support. In reality, however, at any instant of time the top is subject to a rotation about an instantaneous axis, which coincides neither with the axis of figure nor with the vertical line. This instantaneous axis executes a definite conical motion, both in the body and in space.

Clerk-Maxwell (see his collected papers) devised a very ingenious and simple optical method for observing the position of the instantaneous axis, and so studying experimentally its motions with reference to the top. It should be mentioned in conclusion that infinitely small rotations are resolved and compounded according to the same laws as velocities and forces; and that we may regard the instantaneous angular velocity of a rotating body as made up of component angular velocities about any three chosen axes. It is thus that the subject is usually treated analytically. Such a treatment, however, is essentially artificial; and for practical treatment we must go to geometry or to the Calculus of Quaternions (q.v.).

**Rotation of Crops.** In successful tillage farming it is a fundamental principle that the various crops shall be grown in a well-considered rotation. There are solid reasons for this. The plants, like the animals, of the farm differ much in their habits and culture; and the periodical mixture of food upon which they subsist. Although all plants tend to exhaust the soil, they do so in widely different degrees; they withdraw from the soil different kinds and quantities of ingredients. Some of the farm crops have long, penetrating roots, which draw nourishment from the deeper layers of the soil; others have short or spreading roots, which ramify near the surface. Certain crops occupy the ground for a much longer period than others; some encourage the growth of weeds or interfere with the proper cleaning of the land; others facilitate the work of eradicating weeds; and finally, the crop residues of the various plants of the farm differ greatly. A glance at the following figures, giving the average weight of the principal ingredients removed (per acre in lbs.) from the soil by the leading farm crops, will show the importance of growing crops upon a carefully-considered system of rotation.

It is thus obvious that by alternating the root, the cereal, and the grass and clover crops the power of supplying the soil with the substances that the crops need to grow well is increased. The fuller knowledge which is now available both as to the wants of the plants and the means of supplying these wants, it is possible that such an alternation will be practicable, for the farmer to grow with success the same kind of crop on the same land year after year for almost any length of time. A more economical method, however, is to alternate the crops, so that the natural resources of the soil and the repairing influences incident thereto are not entirely lost, and in certain cases, especially in the more fertile and valuable soils, to use the power of conserving that accumulated nitrogen in a form in which it is easily made available to a crop of grain. Polar points often insufficiently considered in tillage farming are the rotation in the growth and in the rotation of the crops which occupy the ground at certain times during which the crop occupies the ground. Judging from the table given above, one would imagine that turnips would require in the form of manure far more nitrogen than is required for wheat. In practice, however, it is well known that exactly the reverse is the case, that nitrogen is used in greater quantities by root crops than by field crops. As a rule the nitrogen is furnished by the crops grown during the winter, and is returned to the soil during the spring and summer; hence the necessity of growing crops which will supply nitrogen to the soil, a high and increasing rate of fertilizer. Many rotations are based upon the Norfolk or four-course system, which consists of (1) clover or
mixed grass seeds; (2) wheat or, in many parts of Scotland, oats; (3) turnips, swedes, mangolds, potatoes, or bare fallow; (4) barley. The details of this system are generally as follows. The clovers or grasses are sown or grazed, when once they are either used green or are dried for hay; the second crop is carted home for the cattle or horses; near towns it is sold off; or it is consumed on the ground in racks by sheep, which on most highly cultivated farms, make a daily contribution of cake to the manure. In districts where the town-manure can be obtained a top dressing is applied as soon as the first crop of grass is cut. On the poor and worse cultivated soils the grass-crop occasionally remains down for two, or even three years, thus extending a fallow. Certain crops are also grown, viz. the clover and manured and deeply ploughed: the grubber and harrows, in April or May, suffice to prepare for the drilling of mangolds or swedes. Heavy land, intended either for roots or barley, should, in spring, be disturbed as little as possible. In Scotland, and the cooler moist districts of the North and west of England, turnips and potatoes are grown on raised drills or balks, in which the manure lies immediately underneath the plant. Frequent horse and land hoings should ensure the thorough loosening of the soil in the neighbourhood of towns, where it is greatly more profitable to sell off the whole of the root-crop, part of the swede or mangold crop is taken home for the cattle, and the remainder consumed by sheep in the field. After the fallow or cleaning crop another clover or barley is grown, under the Norfolk system this is generally barley, with which the clovers or seeds are sown out. Where sewage or tank water is available Italian rye-grass is often used, and on land in high condition early large and repeated cuttings of grass are made. Wheat and barley are, however, much less frequent than formerly, being now confined to the most refractory of clays, or to subjects that are so hopelessly full of weeds as to require for their extirpation several weeks of summer weather, and the repeated use of the steam or horse ploughs, the scarifier, grubber, and harrows. In such circumstances winter vetches are often put in during September, and are often off by sheep and horses in June or July, and the land afterwards cleaned: this practice is extensively pursued on the heavier lands in the midland and southern counties of England. In such localities the following system is approved of: (1) The clover lapse are seeded with (3) wheat; then come (2) beans, pulse, or vetches, manured, horse or hand hoed; (4) on good land wheat succeeds; (5) oats or barley often follow, but, to prevent undue exhaustion of plant-food, this system requires considerable outlay in artificial manures, cake, and corn; (6) a fallow, or fallow crop, chiefly and root-crop, usually manured, and well manured, comes to restore the cleanliness and fertility; (7) barley or wheat is drilled, and amongst this the clover-seeds are sown. On the heavier closer-lands in Scotland the following plan of cropping is usual: (1) Clover; (2) oats; (3) beans; (4) wheat; (5) root-crop, usually including a considerable breadth of potatoes; (6) wheat; (7) barley, with which the clover or mixed grasses are sown. Under this system it is difficult, with so few cleaning crops, to keep the land clean; roots, besides, are not encouraged; this is chiefly made up to supply either cattle or sheep during the winter. To remedy these defects roots may be introduced after the oats, and would be followed either by wheat or barley. This extends the rotation from seven to nine years.

In neater or better cultivated districts, whether of heavy or light land, stock-farming is extending, and a more vigorous effort is being made to raise the fertility of the land. Root-crops are accordingly more largely grown; indeed, it is sometimes found necessary to sow, not by the old method of broadcast, but where there is land to spare, by drills, thus, after turnips, swedes, cabbages, or mangolds, well manured from the town or farmyard, and eaten off by sheep, potatoes of superior quality are produced with one ploughing and a dose of portable manure. Specialities of management occur in almost every locality. Near London, and in other southern districts, early potatoes or peas are grown for market, and are immediately followed by turnips. In many parts of England, where the soil and climate are good, rye or vetches sown in early autumn are cultivated in early summer, and a root-crop then put in.

Good rotations do not necessarily ensure good farming; they are merely means to an end. As to agricultural education and enterprise extend fixed rotations will be less regarded. The market-gardener, who extracts a great deal more from his land than the farmer has hitherto been able to do, does not adhere to any definite system of cropping. If the farm is kept clean and in improving condition there can be no harm in growing whatever cereals or root-crops it is possible to plant, provided that the latter are requisite during only the three or four last years of a tenancy. The restrictions found in some agreements, preventing the growth of clover for seed, flax, and even potatoes, are inadmissible. Equally objectionable are clauses against the sale of particular sorts of produce, such as hay or roots. The farmer, if he is fit to be entrusted with the use of the land, ought to be permitted to grow or sell off any crop he pleases, provided an equivalent in manure be brought back. On well-cultivated land, in good condition, it is now the practice of the best farmers to take oats or barley after wheat; indeed, some of the best maturing barley in Essex, on the Scottish carse-lands, and elsewhere is now grown after wheat. The frequent growth of cereals, and the heaviest of hay and root-crop, are made by the farmer, may be fairly compensated for by judicious and liberal treatment with town-dung, sewage, or artificial manures. The plant-food disposed of in the more ordinary sales of the farm is economically restored by the careful management of land, even when removed from the farm, by the application of soda, or by keeping plenty of stock on the farm, and supplying them liberally with cake and corn. See also the articles AGRICULTURE, FALLOW, MANURE, SOILS, and those on the various crops. Rotatoria, or Rotiferia, a class of minute aquatic animals, popularly called wheel-machines. Most of them are microscopic, very trans-
Hydatina scuta;

\[(The \text{ Rotifer, Hudson and Gosse.)}\]

of the eggs, which can remain for a long time quiescent. There are three kinds of eggs—small oval, which develop into males; thin-shelled summer oval; and thick-shelled resting or winter oval. And it is said that a given female produces only one kind. Sometimes they are laid in the water, or attached to water-plants; sometimes they are hatched within the mother. In most, if not all cases, the sexes are parthenogenetic, developing without fertilisation. For in one series of rotifers (Philodinae) the females have never been found; while in other cases the males, which are usually smaller and simpler than the females, do not succeed in fertilising the eggs. As representative rotifers the following may be mentioned: Rotifer vulgaris, very common in stagnant fresh-water pools; Hydatina scuta, with exceedingly rapid development; Melicaeta, which forms an ensheathing case of disengaged pellets; the parasitic Sisson, Albertin, Balataro, which have lost, or almost lost, the characteristic ciliated wheel; Floscularia, living in a gelatinous case; the exceedingly beautiful Stephanoceros; Pedalion mirum, a unique jumping rotifer, with six long leg-like appendages. The zoological position of rotifers is uncertain, but some regard them as remotely allied to Chordopoda worms.

Rotche, or Little Auk. See Auk.

Rothausen, or Rothamstead Park, 4 miles N.W. of St Albans, is noted as the scene of the agricultural experiments of Sir J. Bennet Lawes. See Agriculture, Vol. I. p. 103.

Rothe, Richard, one of the greatest speculative theologians of Germany, was born at Posen, 28th January 1779. At the universities of Heidelberg and Berlin he had among his teachers Danh, Hegel, Schleiermacher, and Neander. After a two years' course in the clerical seminary at Wittenberg and a short period of lecturing as privat-doent at Breslau he set out for Rome in December 1823 as chaplain to Bunsen's embassy. In 1828 he accepted a professorship in the Wittenberg seminary, whence in 1829 he migrated to Apollinaris and in 1837 to Heidelberg. In 1849 he accepted a call to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of Theology and member of the Oberkirchenrat, and there he died, August 26, 1867. Rothe was one of the noblest types of the theologian that Germany has produced, in his rare combination of simple inward piety with fearless boldness of thought. The patient care he lavished on a wife afflicted with a mental malady, the great personal influence he exerted over his students, his humility, charity, and that magnificent prophetic optimism that already saw the whole universe aglow with the glory of the Redeemer, all testify alike to the beauty and elevation of his character. His conception of the kingdom of God founded by Jesus reminds an English reader of the grand scheme of Huxley and Hore-Belisha. In his identification of the social and moral functions of church and state, in a kind of refined and glorified Erastianism. Indeed the special function of the church will come to an end as soon as the state has become permeated with the religious view, its purpose being only that of a temporary instrument in the establishment of this ultimate ideal. The real end of Christianity is to create no hierarchical theocracy, but a spiritualised community with all its social and political functions harmonised with the divine morality. Profane and sacred sciences will be length coalesced, all education will become religious, and the instinct of worship will find nourishment in a regenerated theatre and an elevated art. The work of the church meantime is essentially educative and preparatory—itself a means and not an end—and all and every influence combined. And the supreme conception of the invisible church was an attempt to avoid the difficulty of the Catholic theory, but it created a purely spiritual community, separated from the ordinary interests of social and national life, and with a fatal tendency to the error of a divorce between religion and morality, the former emphasising the interests of the individual for eternity, the latter relating merely to his social duties here—in themselves considered as of no religious value.

Rothe's theory deals a deathblow to clericalism and all exaggeration of the importance of the external organisation. It may be that it will be for ages yet to come nothing beyond a devout imagination, but at least it is a splendid attempt to realise the Christian dream of the kingdom of God, to carry into effect Christ's distinction between mere outward form and inward spirit, and the eternal fact that it is in life as God Himself has made it that the power and spirit of the gospel ought to manifest itself. This speculative theory is worked out in the first of the three books of Rothe's unfinished work, Die Aufsaugende Christologie (1837). The remaining second and third books are historical. His greatest work is his Theologische Ethik (3 vols. 1845-48; 2d ed. completed by Holtzmann from his papers, 5 vols. 1869-71), which supplements the preceding book, being based on the same fundamental identity between religion and morality, the starting-point being the idea of God involved in consciousness, and con-
sidered in relation to the world and to man. Here in his pursuit of analogies into the world of science. Rotherham too often leaves behind him the solid earth of reality, and ventures on hypotheses that are little better than visionary, and, moreover, his style is nocebrupt, obscure, and perplexing. *His Dogmatik,* posthumously edited by Schenkel (3 vols. 1870–71), completes his ethics. Here he distinguishes sharply between Revelation itself and the Bible—its documentary record. The former is not so much a supernatural communication of religious truth as an act of God's creative form of God's redemptive activity, strengthening and rectifying the religious consciousness of man disturbed by sin. The true object of Revelation is the knowledge of God; its mode of operation is not magical, but is accompanied by an internal action on the consciousness producing a special receptivity by means of which the external manifestations in history and nature may be understood. It is supernatural in its cause, but natural in its method, although admitting alike of inspiration, of miracle, and of prophecy—of the analogies of nature, but rather inherently constituent elements of a Revelation, subserving higher laws of nature unknown to man's limited faculties, but perfectly homogeneous with a divine order.

During his last ten years, after the formation of the Prussian Empire, Rotherham took an active part in ecclesiastical affairs, as a leader in the School of Conciliation. He was an admirable preacher, but with characteristic modesty could hardly be induced to publish his sermons. Schenkel edited three volumes in 1869, but took unwarrantable liberties with the text, in the way of modifying the supernaturalism. A fourth and reliable volume was edited by W. Höibe in 1872.

The Prolegomena which Rother had contributed to *Studien und Kritiken* he collected under the title *Zur Dogmatik,* and published in 1875. Under his direction was the book already named, there were edited from his papers *Vorlesungen über Kirchengeschichte,* by Weingarten (2 vols. 1875–76); *Abenddankfei der Pastoralbriefe,* by Pfeiffer (2 vols. 1870–77); *Der erste Brief Johanne,* by Mühlhäuser (1875); *Theologische Encyklopädie,* by Kappelius (1880); *Geschichte der Predigt,* by Trümpermann (1881); *Gesammte Fortritte u. Abhandlungen,* by Nippold (1881), also edited by Schenkel (1872); Eng. trans. 1886) and wrote his Life (2 vols. 1873–74).

Rothschild, a town of Bavaria, on the Tauber, 36 miles W. by S. of Nuremberg, preserves its medieval character in great part unaltered. Pop. 6221. The town produces a periodic procession and historic play in memory of its escape from being sacked in the Thirty Years' War, during which the town (then a place of 18,000 inhabitants) was repeatedly taken and retaken.

Rotherham, a busy manufacturing town in the West Riding of Yorkshire, on the right bank of the Don, here joined by the Rother, 5 miles ENE. of Sheffield by a railway opened in 1838. Its manufactures are mainly in cotton and woollen. Its Perpendicular style, with crocketed spire and fine west front. It is probably somewhat earlier than its reputed founder, Thomas de Rotherham, Archbishop of York (1423–1500); in 1875 it was restored by Sir G. G. Scott at a cost of £9000. A handsome edifice in the Collegiate Gothic style, built for an Independent College in 1875 at a cost of £20,000, has been bought for £9000, and applied to the purpose of a grammar-school (1843), at which Bishop Sanderson was educated. There are also a mechanics' institute (1823), a free library (1881), an infirmary (1870); a covered market (1879); public baths (1887); a park (1876) of 20 acres, 300 feet above the town; and the Clifton Park of 57 acres, which, costing £25,000, contains a fine mansion-house, and was opened by the Prince of Wales on 25th June 1891. The manufactures include stoves, grates, chemicals, pottery, glass, railway-carriages, &c. Ebenezer Elliott was a native of the suburb of Masborough, which is included within the municipal boundary, incorporated in 1871. Roselle Abley, a ruin, 8 miles ESE., was a Cistercian abbey, reduced (1542) to a manor, and returned to Conisborough Castle, noticed at DONCASTER. Pop. (1851) 6225; (1871) 25,592; (1881) 34,782; (1891) 42,050. See John Guest's great *Historical Notices of Rotherham* (1879).

**Rothsay,** a favourite Scotch watering-place, the capital of Buteshire, is beautifully situated on the north-east shore of the Island of Bute (q.v.), 40 miles by water W. of Glasgow and 19 SSW. of Greenock. 'Sweet Rothsley Bay,' rimmed by hills 400 to 530 feet high, offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Its charming scenery, its bathing facilities, its sheltered position, and the extreme mildness of its climate have rendered Rothsley a resort alike of holiday-makers and of invalids, especially those affected with pulmonary disease. Its linen and cotton manufactures, tanning, and boat-building are almost or quite extinct; and the herring-fishery is now the only important industry. The Clyde steamers touch regularly at Rothsley, whose commodious harbour was constructed (1822–84) at a cost of over £30,000. An esplanade was formed in 1870; and among the chief edifices are the county buildings (1822–23), public hall (1879), aquarium (1876), academy (1869), and Glenburn hydrophatic (1843; burned down in 1891, and rebuilt). In the middle of the town are the ruins of Rothsley Castle, founded about 1098, taken by Hacon of Norway (1263), the death-place of Robert III. (1406), Erskine, 1st Earl of Winton, and assigned to min (1651) by the Earl of Argyll; bought by the Marquis of Bute, at a cost of £8000. Rothsley since 1398 has given the title of duke to the eldest son of the Scottish sovereign. Created a royal burgh in 1400, it returned a member from the Union till 1868. Pop. (1821) 4107; (1881) 6229; (1891) 9106. See books by J. Wilson (1848) and Thoms (1870).

**Rothschilds,** the well-known family of bankers, take their name from the sign of the house ("Zum Rothen Schilde,' or 'red shield'"), in the Jews' quarter of Frankfort, in which their ancestors lived. The real founder of the family as financial magnates was Mayer Amschel Rothschild, who was born at Frankfort in 1743. Although educated for a rabbi, he embarked in the banking business at Hanover, and, having saved a little money, started for himself as a money-lender and dealer in old coins in the family home at Frankfort. He won the confidence of the landgrave of Hessia, who entrusted his finances to the Jew's management. The current story, that he successfully hid the fortune of the landgrave from the French invaders in 1806, and was through his patron's gratitude allowed to have the almost unbroken family charters of his house, by this means laid the foundation of a large fortune, is extremely doubtful. The beginnings of his fortune were in all probability less romantic: the Rothschild house got a heavy commission for transmitting money from the English government to Wellington in Spain during the eight years of the Napoleonic war; they managed the large private fortune of the landgrave; through them the British government made its payments of subsidies to continental princes; they negotiated for private fortunes of large loans, and left a mark between 1804 and 1812. At his death, on 13th September 1812, Meyer Amschel Rothschild left five sons, all of whom were made barons of the Austrian empire in 1822.

**Anselm Meyer,** the eldest son, born in 1773, died 1855, succeeded as head of the firm at Frankfort.
SOLOMON (1774–1835) established a branch at Vienna; NATHAN MEYER (1777–1836), a branch in 1798 at London; CHARLES (1788–1855), a branch at Naples (discontinued about 1861); and JAMES (1792–1868), a branch at Paris. Apart from their very extensive private banking business these houses have been deeply concerned in negotiating many of the large securities of the 19th century. The cleverest man of the five was Nathan, who really lifted the house into its position as first amongst the banking-houses of the world. He pinned his faith and staked his fortunes on the success of Britain in her great duel with Napoleon, and is said to have been present himself at the battle of Waterloo, from which he hastened home to London, where, before the result of the battle became known, he had sold and bought stock that brought him one million sterling clear profit. He was succeeded by his son LIONEL (1865–79), who distinguished himself by his efforts to effect the civil and political emancipation of the Jews in Great Britain. The present head of the London branch is Lionel’s son, Sir NATHAN (born 1840), who succeeded to the baronetcy conferred in 1847 on his uncle. He was raised to the peerage as Baron Rothschild in 1885. His niece Hannah (1831–99) was in 1877 married to the Earl of Rosebery. See Reeves, The Rothschilds (1887), and Das Haus Rothschild (Prague, 1857).

**Rothsfe.** See ROTATORIA.

**Rotomahana.** See NEW ZEALAND, p. 487.

**Rotron, Jean de,** a French tragic poet, second only to his friend and contemporary Corneille, was born at Dreuax, August 21, 1609, went early to Paris, and became a bullfighter, as well as one of the five peers—the others were Corneille, Colletet, Bois-Robert, and L’Etouli—who worked up into dramatic form the ideas of Richelieu. His first piece, L’Hypochondriaque, was followed by La Bague de l’Epee, an imitation from Lope de Vega, and that by Cleangusor et Doristae, Diene, Les Occasional Perdues, L’Heureuse Constance, all in the Spanish romantic style. Next followed a busy period of classical dramma, culminating in his last years with three masterpieces, Le Veritable Saint Genes, a tragedy of Christian martyrdom under Diocletian; Don Bertane, a comedy; and Venecia, which kept the stage almost down to our own day. Tradition tells that Rotron led a dissipated life in Paris, and further was inordinately addicted to gambling; more honourable is the authentic history of his death. He held an official post at Dreux, and when he heard that the plague had broken out there, himself that the Tournaians had fled like Montaigne in the same circumstances from Bordeaux, he hastened to the town to preserve order, caught the pestilence, and died a few hours after, June 23, 1650.

As many as thirty-five of his plays are still extant, but many more are lost. A complete edition was edited by Violet-le-Duc (5 vols. 1820–22); six of the plays, by M. de Rondard (2 vols. 1822). See Jarry’s Études (1683), the works by Person on Saint-Genes (1862) and Venecia (1863), and G. G. Stenver’s L. (1881).

**Rotenburg,** an episcopal town in Württemberg, 6 miles SW. of Tübingen, on the Neckar, has an old castle, now a prison, and a cathedral, and trade in hops and timber. Pop. 7,310.

**Rottenstone,** a soft and earthy stone, consisting chiefly of alumina, with about 10 per cent. of carbonaceous matter and a little silice. It is sup-

### Rotterdam

**Rotterdam,** the busiest port of Holland, stands on both sides of the Maas, 10 miles from its mouth, and 16 miles by rail SE. of the Hague and 45 SW. of Amsterdam. Since Holland was separated from Belgium, the trade of Rotterdam has grown at an extraordinarily rapid rate, especially since the middle of the century. New wharves and quays and new docks have been built almost every year since 1847. In 1888 the quays measured 16 miles in length and the docks covered an area of 190 acres; and since then two new docks have been made and the (separate) petroleum wharves have been extended. Since 1872 sea-going vessels have ceased to approach Rotterdam by the old channel of Brill (Brillie); they have used instead the New Waterway—i.e., the Maas and the Scheur, the latter of which has been connected with the sea by a canal cut through the Point (Hoek) of Holland. Every effort has been made to render this new waterway available for large ocean-going steamers, and the work of improvement has been constantly going on ever since it was opened, until in 1890 it had a depth never less than 22 feet at low tide, and big ships were able to reach the sea in two hours from Rotterdam. Taking all the vessels that enter all the ports of Holland from a road, more than 53 per cent. (estimating by tonnage) enter at Amsterdam. The net tonnage of the vessels (which numbered 4,535 in 1890) so entering doubled between 1875 and 1890, and was in the latter quoted year eight times what it was in 1850—viz. 2,918,425 tons in 1890 as against 1,411,828 in 1875, and 346,186 in 1850. To this foreign trade must be added 84 per cent. of the total trade between Germany and Holland by way of the river Rhine, or (in 1890) some 2,582,800 tons, and a traffic of 6,850,000 tons carried on in the inland canals and streams. If all these items be put together the total tonnage of vessels entering Rotterdam annually is nearly 121 million tons, a figure that is only exceeded by London amongst European ports. But, on the other hand, it must be remembered that the bulk of the inland traffic would in other countries be counted amongst the statistics of goods brought by railway. The figures quoted do not include the returns of the shipping fleet, which sells in Rotterdam fish (chiefly herring, cod, &c.) to the value of £20,000 per annum. The merchant fleet of Rotterdam itself numbered, in 1899, 150 vessels of about 369,000 tons. The imports consist principally of mineral ores and
metals, grain (wheat, rye, oats, maize), coal, oil (petroleum chiefly), seeds, tallow and similar greasy substances, sugar, rice, tobacco, hides, indigo, &c.; whilst the more important exports are linen, flax, butter, cheese, cattle, and spirits (gin, &c.). From this period the yearly average between 2300 (1885) and 15,300 (1889) emigrants from the most parts of Europe, most of whom go to the United States. There are flourishing industries, as iron and other metal works, shipbuilding, distilling, sugar-refining, and the manufacture of tobacco, chemicals, &c.

The town is connected by railways which communicate with the Maas, whilst their banks serve as wharves. On the south side of the river, opposite the city proper, are the busy ironworks and shipbuilding-yards of the island of Fijenoord, besides some of the largest docks. This island is connected with the other bank by two lofty bridges (one a railway bridge). In the city the more important buildings are the Gothic church of St Lawrence (15th century), with a very large organ, the monumental tombs of the Dutch admirals Witt, Cortenaer, Van Brakel, Van Liefland, others, and a lofty tower (295 feet high); the Boyman's Museum (1847), with a fine collection of paintings by Dutch masters; the yacht club-house, containing an ethnological collection; the town-house, exchange, and other public buildings. The public institutions include an academy of arts and sciences (near 1100 pupils), schools of music, navigation, and the technical arts, and an excellent zoological garden. Pop. (1890) 203,472, with which compare the figures for earlier years—7,500 in 1630, and 104,724 in 1855. Rotterdam counts as her most illustrious sons Erasmus and the poet Tottens; James, Duke of Monmouth, and Grining Gibbons, the English wood-carver, were also born here. The history of the place is marked by very few notable events, except its capture in 1637 by François de Brederoel in 1488, who lost it to the Austrians in the following year, and the occupation by the Spaniards in 1572.

Rottli, an island in the Indian Archipelago, belonging to the Dutch, lies to the south-west of Timor. It is 36 miles in length (655 sq. m.), and has a pop. of 60,000. The surface, though hilly, is now covered with rice above the sea, and the fertile soil produces a rich vegetation.

Rottlera, a genus of trees of the natural order Euphorbiaceae, found in India and other parts of tropical Asia. The most important species is Rottlera tinctoria (Roeburgh), subsequently called after Malus philippinensis. It is a small tree, the wood of which is of value, but its bark is employed for tanning, and the crimson powder which covers the ripe fruit is used for dying silk, and also as a purgative and anthelmintic.

The R. tetraecu and R. petiolaris of Roeburgh have also been included in the genus Mallotus by Müller under the names M. albus and M. roxburghianus.

Rottweil, a town of Württemberg, on the Neckar, 68 miles by rail S. by W. of Stuttgart, has manufactures of gunpowder and silk and cotton factories, and railway workshops. Near by, on the site of an ancient Roman colony, a number of antiquities, including a valuable piece of mosaic work, have been discovered. Pop 6052.

Rotunah, an island in the south Pacific, annexed to the Fiji Islands by Great Britain in 1881, is distant about 300 miles NNW. from the nearest island of that group, of which it is a dependency. Area, 14 sq. m.; pop. 2900, all Christians.

Roturier (according to Littre from ruptura, Low Latin for ground broken by the plough), under feudalism, when the feudal theory of knight's service was recognised as the only principle of gentle tenure, one who continued to hold by the older or alodial tenure, and was accordingly regarded as incapable. See FEUDALISM, ALLODIUM.

Roubaix, a town in the north of France (dept. Nord), 6 miles by rail NE. of Lille, it rose into importance during the 19th century. Here is a market for men's clothing, shawls, stuffs for furniture and ladies' dresses, velvet and similar textiles, chiefly of wool, cotton, and silk, are manufactured to the annual value of £6,000,000. Besides these things, thread, sugar, beer, spirits, &c., are produced, and there is a very active trade in these manufactured goods. Pop. (1810) 9000; (1876) 74,846; (1891) 103,191.

Roulliaee, Louis-Francois, sculptor, was born at Lagny in 1835, studied mainly at Paris, where in 1730 he obtained the second Grand Prix, and shortly thereafter settled in London. In England he espied his name Roullie. He visited Rome in 1745. His statue of Handel for Vanxhall Gardens in 1738 first made him popular. His other most famous statues are those of Shakespeare (executed for Garrick, and now in the British Museum), of Sir Isaac Newton at Cambridge, and another of Handel in Westminster Abbey. The monuments of the Duke of Argyll and of General Wade in the Abbey are also well known. He contributed largely to the development of British taste in sculpture, though his own work did not mean so perfect as his contemporaries imagined; he has been called an exquisite executant but poor designer. He died in London, 11th January 1762. See the Life by Le Roy de Sainte-Croix (Paris, 1882); A. Dolson in Eighteenth Century Vignettes (1894).

Roule, the unit of the Russian money system, first cut from silver bars in 1321, and coined in 1655. There are now gold imperial and half-imperial of 10 and 5 roubles. But most of the currency is paper, and the ratio of the gold rouble to the paper rouble was in 1856 fixed at 1 to 1. In 1897 imperials and half-imperial were coined of 15 and 75 roubles (i.e. paper roubles). The silver rouble is nominally worth 3s. 2d. But when silver is at 20d. per oz., it is really worth 1s. 4d.; at 30d. per oz. 1s. 6½d. In 1888 silver was 42½d.; in 1890, 47½d.; in 1894, 29d.; in 1895, 26½d. The rouble is divided into 100 kopeks.

Rouen (Lat. Rotomagus), formerly the capital of Normandy, and now the chief town of the department of Seine-Inferieure, and after Lyons perhaps the principal manufacturing city of France. It stands on the River Seine, 87 miles N.W. of Paris by railway. The ramparts have been converted into spacious boulevards, little inferior to those of Paris. The modern streets are well and regularly built, with good stone houses; but a considerable part of old Rouen still remains, consisting of ill-built picturesque streets and squares, with tall, narrow, quaintly carved, wood-framed and gabled houses. The Seine, upwards of 300 yards broad, makes Rouen, although 80 miles from the sea, the fourth shipping port of France; and the great tides, in the way of deepening the river and building quays, are yearly adding to its capacity and importance, no less than £710,000 having been expended on the port between 1851 and 1857.

A stone bridge and a suspension bridge lead to the Faubourg St Sever on the left bank. Rouen possesses several remarkably beautiful Gothic churches—in particular the cathedral (13th century onwards), St Ouen (14th-15th century; perhaps the finest of the times of Gothic in existence), and St Maclou (florid style of the end of the 13th century). The cathedral, the seat of an archbishop, begun by Philippe Auguste, has a very rich west façade, and two fine though unfinished west towers—the south one (Tour de Burre)
was built (1455–1507) with indulgence money received for permission to eat butter during Lent— but is reputed to be a lofty cast-iron spire (487 feet) erected upon the central tower in 1876 in consequence of an old wooden belfry, which bore the date 1544, having been destroyed by fire in 1822. It contains in its twenty-five highly ornamental chapels numerous tombs and monuments of great interest, of Rollon and his son William Longsword. The heart of Richard Cœur de Lion, once buried there, is now preserved in the extensive Museum of Antiquities. Among other noteworthy buildings in Rouen are the palais de justice (13th century) and the hotel de ville, with its public library of 110,000 volumes, and its gallery of pictures; and the Hôtel Dieu, one of the largest of its kind. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated Roumaines, nankeens, muslin, cotton-vetements, shawls, &c. Rouen has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen yarns, shot, steel, lead, chemicals, paper, confectionery (Sucre de pomme), &c. There are also engineering works. Pop. (1872) 102,476; (1891) 112,109.

History.—Rouen is specially interesting to Englishmen as the capital of the Northmen in France, and the first home of the Norman dukes. It was the scene of the baptism and marriage with Gisela, daughter of Charles the Simple, after that monarch had been constrained to cede Normandy under the treaty of Claire-sur-Epte (912), and there he and his successors lived until Duke William transferred his court to Winchester after the conquest of England (1066). At Rouen William died (1087), and till the time of John it continued the seat of government of the Norman possessions of the English kings. In 1204 it was taken by siege by the French king Philippe Auguste, and annexed along with the main part of the duchy to the French crown, in which state her situation, and which is called in memory of her Place de la France. Rouen was the birthplace of Cornelle (1606), of Fontenelle (1657), of Boieldieu (1773), of Armand Carrel (1800), and of Flaubert. Clarendon died here. It was occupied by German troops in 1792–71. See Fouquet's Histoire de Rouen (1875), and other works cited at NORMANDY.

ROUERGUE, an old province of southern France, between Languedoc, Auvergne, and Gienne, ruled by counts until 1589, when it passed to the crown. See FRANCE, Vol. IV. p. 770.

ROUGE, a powder used to give artificial colour to the cheeks. For common purposes vermilion rubbed up with almond-oil is employed, but the safer and better quality is prepared from carmine (the colouring matter of cochineal), either alone or mixed with the safflower colour. These are generally rubbed up with French chalk, and supplied either as powder or, along with a little oil, in the form of saucers.

Jeweller's rouge is an impalpable preparation of oxide of iron, obtained by gently heating the yellow rust of iron, after decomposing the chromic acid escaping, and only a red powder being left. It is used for polishing silver, and for this purpose should be of the finest quality. Many cheaper varieties are sold under this name.

ROUGE CROIX, DRAGON. See HERALD.

ROUGE ET NOIR (Fr., 'red and black'). TREnte-EN ('thirty-one'), or TREnte ET QUARante ('thirty and forty'), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is of a form similar to that shown in the figure. It is divided into four portions, each marked in the centre with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted either a yellow colour (not represented in the figure). The game is played as follows: one of the tailleurs (or dealers, who manage the table, take charge of the bank, and keep an eye on the players) takes up his position at one side of the table, opposite to the croupier (another tailleur), and unseals, in the presence of the players, six packs of cards, which are first counted, then shuffled by several tailleurs, and returned to the first tailleur, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated noir, rouge, couleur, and Paire, which will be afterwards explained. After the stakes have been laid on the table (those for the noir being laid on either of the quarters marked with a black, and those for the rouge on either of the quarters marked with a red diamond), those for the 'couleur' on one of the transverse bands, and those for the 'inverse' on one of the yellow circles at the end of the table), the tailleur takes a handful of cards from the top of the pack, and deals first for the noir, taking one card after another from the top of the pack, and placing them on the table side by side, till the number of pips on them amounts to more than thirty, when he stops. He then deals out another row in a similar manner for the rouge, till, as before, the number of pips amounts to more than thirty. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards ten each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than thirty and not more than forty. If the value of the first row is nearer thirty-one than that of the second, then the first row, or noir, wins; if the contrary is the case, then the second row, or rouge, wins. Couleur wins if the first card talked by the tailleur is of the winning colour—for instance, if the first card laid down is a 'spade' or 'club,' and if noir wins; but if the first card dealt is of the winning colour, then inverse wins, and couleur loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake and winnings, while the stakes of the
losers are raked by the tailleurs to the bank in the centre of the table. When the value of the first, or no balls, is reaped, a new turn is taken, and if a row, it is a refait, and the dealer must commence to deal anew from the cards remaining in his hand; when the refait occurs the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper. The game of Roulette would be impossible between the players and the bank were it not for the following regulation: When the points dealt for the noir and the rouge each amount to thirty-one ('un refait de trente-et-un') the half of all the 'en playing pieces belongs to the bank, and this the players may either pay or have their stakes 'put in prison,' the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of thirty-one occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one-half, which goes to the bank, and the other half is 'put into the second prison,' from which it requires two successive winnings of the player to regain them. The chance of 'un refait de trente-et-un,' as it is called afterwards, is given to this game by a superseeded Faro (q.v.) and Biribi in France about 1789, but along with Roulette was forbidden by law in 1838. See work cited at ROULETTE.

**Rouget de Lisle, Claude Joseph**, author of the Marseillaise (q.v.), was born at Lyons-Le-Saulnier on 10 May 1760. When in 1792 he wrote and composed his celebrated song, he was a captain of engineers stationed at Strasburg. Four months later, as too moderate a republican, he was imprisoned in Paris, but was released after Robespierre's fall. Wounded at Quiberon (1796), he quitted the army, and lived in Paris in narrow circumstances, until Louis-Philippe, who superseded him as minister of the interior, was awarded him a small pension. He died at Choisy on 26 June 1836. He published in 1796 a volume of Essais en Vers et en Prose; but none of the pieces it contains, nor indeed any of his other books, possess much real merit. The Marseillaise was his one inspiration. See a Memoir by Poisie-Desgranges (Paris, 1864), and one by tiersot (1892).

**Rouhier, Eugene**, a French statesman, was born at Riom, on November 30, 1814, practised there as an advocate up to 1843, and then was returned to the Constituent Assembly. Towards the end of 1792 he was appointed minister of Justice; and with slight interruptions he was for twenty years a member of the French government. He was chiefly instrumental in negotiating the treaty of commerce between France and England in 1850, and that between France and Italy in 1856, and was thus instrumental in preparing the way for the introduction of the free-trade policy of Napoleon III. In 1863 he was appointed minister of State, and maintained that position until 1870, when he became president of the Senate. A staunch supporter of Napoleon III, and a clever debater, Rouhier was next after the emperor, the chief supporter of the system, domestic and foreign, which came to a disastrous end at Sedan—he was sometimes called the Vice-emperor. After the fall of the empire he fled abroad. But he was returned to the National Assembly for Corsica in 1872, and sat till 1875 as a staunch defender of the emperor. He died at Paris, 31 February 1884.

**Roulers** (Eenm. Rousselers), a town of West Flanders, Belgium, 19 miles by rail SSW. of Bruges, has manufactures of cottons, lace, and clothing. The town is a junction, defeated the Austrians on 13 July 1794. Pop. (1887) 19,735; (1896) 21,693.

**Roulette** (Fr., 'a little wheel'), a game of chance which from the end of the 18th century till the beginning of 1838 reigned supreme over all others in Paris. It continued to be played at 8,000 francs was wagered on two lines, and as in terms of an act passed four years before Roulette then found a home at Monaco. It is played on a table of an oblong form, covered with green cloth, which has in its centre a cavity of a little more than 2 inches in diameter, into the shape of a punch-bowl. The cavity is richly described, and copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the centre of the cavity, the handle by which motion is communicated. The number of chances last described are numbered 38, of red and double zero; and these 38 symbols are also numbered at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words—pair, passe, noir, impaire, manque, rouge, which will be seen from the following table and the drawing: The game is played as follows: One of the tailleurs puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity at intervals an opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake his money on 1, 2, or any of the 38 numbers (including the zeros), and shows what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the tailleurs 36 times his stake—viz. his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, &c. The blank rectangles at the bottom of each of the 3 columns of numbers figured on the table are for the reception of the stake of that player who selects a column (12 numbers) or a series of chance, and to the odd or even position of the ball. If the ball enters a hole the number of which is found in his column, he is paid 3 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win immediately receive double their stake (in 13 cases much more), and under the following circumstances: The 'pair' wins when the ball falls into a hole marked by an even number; the 'impair,' if the hole is marked odd; the 'manque,' if the hole is numbered from 1 to 18 inclusive; the 'rouge,' if it is coloured red; and the 'noir,' if it is coloured black. If the ball should fall into either of the holes marked with the single or the double zero, the stakes of those players who have staked upon chance are divided equally between the bank and the players, or as is more commonly the case, they are 'put in prison,' as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that the trial the ball again falls into one of the two holes marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are 'put into the second prison,' and so on. The tailleurs thus have an advantage over the players, who bet upon the numbers: labours under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances,
still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he wins, whereas he only receives 35 times that amount, a manifest advantage in favour of the bank in the proportion of 37 to 35. See Professor J. S. Bond, The Problems of Roulette and Trente et Quinante (New York, 1889).

Roumania, a kingdom in the south-east of Europe, situated between 23° 29' and 29° 42' E long., and between 42° and 48° 45' N lat. Its general boundaries are on the east and south the river Pruth and Danube (with the exception of the Dobrudja, a province south of the latter river at its embouchures), and on the west and north the Carpathian Mountains, along whose heights the boundary line runs. The kingdom presents the form of an irregular blunted crescent, some writers comparing it to a sausage. Its average length is about 335 and its breadth about 188 miles; its approximate area is 49,250 sq. m., and its population (1895) was 5,417,260, including 290,000 Gypsies. Of these 45 millions, belong to the Greek Church (the national religion), and the remainder are Protestants, Jews, &c. There are believed to be about 4,000,000 of Roumanians outside the Roumanian kingdom—in Hungary and Transylvania, Bulgaria and adjoining Russian provinces, Servia and Bulgaria.

The general configuration of the surface of Roumania is an irregular inclined plane, sloping down from the Carpathian Mountains to the northern bank of the Danube, and it is traversed by numerous watercourses (many of which are dry in summer), taking their rise in the mountains and falling into the great river, which render the country well adapted for every kind of agricultural industry. Roumania is divided, roughly speaking, into the two provinces of Wallachia and Moldavia, the first being the Danube, the second on the Pruth. These were formerly distinct principalities, were then united as Moldo-Wallachia, and finally incorporated as an independent kingdom under Charles I. The capital of Roumania is Bucharest in Wallachia, about 30 miles from the sea. The chief town. Moldova, is Iassy, not far from the river Pruth. The other towns of any note in Roumania are the seaports of Galatz and Ibrail (or Braia) at the mouth of the Danube, Craiova (Krajova), Botoshani, Ploesti (Plojeschi), Piesti, and the ancient capital Curtea de Arges. Roumania possesses one of its beautiful cathedrals, built of a grayish-white limestone resembling alabaster, in the Byzantine order of architecture, with a profusion of Moorish or Arabesque ornamentation.

The most noteworthy peaks of the Carpathians rise from 3000 to 3600 feet above the sea-level, the highest two being Caraiman and Verful, from which a distant view of the Balkans, in Bulgaria, is obtainable in clear weather. Near the foot of Caraiman, at the junction of three valleys, and surrounded by lovely wooded slopes, nestles the charming summer-resort of the court and upper-class, Sinaia. Here the king and queen occupied an old monastery until a beautiful palace was built in the Italian style, where the court spends a considerable portion of the summer. Besides the palace there are many handsome private residences, as well as a public library (in 1892 there were in the palace 13,424, with a tonnage

near Campina, as well as elsewhere, and there are refineries at Tirgovista, Ploieschi, &c. The chief products of agriculture are maize and cedars, which are largely exported, and amongst the fruits of the country peaches, pears, apples, pears, and grapes are conspicuous and plentiful. The sylvan scenery of the Carpathians is very lovely, and either there or in the plains are to be found the oak, elm, beech, and, less frequently, the maple, sycamore, mulberry, lime, horse-chestnut, and acacia. The usual flora of the sub-tropical and temperate zones flourish luxuriantly, and at Ferestrem, near Bucharest, there is an excellent agricultural and sylvicultural college. The manufacturing industries of the country are still in their infancy, and are greatly handicapped by the cheap productions of Germany and Austria. They include flour and saw milling, match-making, and petroleum-distillation, to which have been added (through an act passed in 1887 for encouraging Roumanian industry) tannin, boot and shoe making, and cement manufacture. Notwithstanding the large importation of manufactured articles of various kinds from Austria, Germany, France, and Great Britain, the peasantry are mostly clothed in garments made by themselves of home spun, woven, and embroidered fabrics, and they possess such taste and skill in the manufacture and ornamentation of cloth, gauze, and muslin, and in the trimming of costumes, that their work finds a ready market in the best establishments in the capital.

The most remarkable feature in the agricultural system of Roumania is its peasant proprietor, which was created about the year 1864. Before that year the whole of the land of the country was practically held by the boyards or inferior nobles, who were frequently absentee, or by the state, for the peasants merely owned small patches of land contiguous to their dwellings, which were now and again, by some semi-subterranean sleight of hand, robbing of their land during long ages of feudal oppression and foreign conquest, but when the government became democratic it was determined to restore a portion of it (about one-third) to its rightful owners, and to otherwise have fallen into the hands of usurers. The result was that in 1890 there existed in Wallachia and Moldavia, 406,933 holdings, averaging 10-6 acres each, and the great change has added materially to the prosperity of the country and its thrifty peasantry.

The government of Roumania is a hereditary limited monarchy, and the constitution provides for an irresponsible king, who must belong to the Orthodox Greek Church; a council of ministers; a senate and a chamber of deputies. The members of both houses are indirectly chosen, mainly by colleges of voters; but the large towns elect directly. Senators are elected for eight years, one-half retiring every four years. Members of the lower house sit for four years, but either chamber may be dissolved separately. The income of a senator is proportioned to the number of shareholders at the most important political institutions in Roumania is largely concerned is the 'Danubian Commission' (see Danube), whose headquarters are at Galatz. There is a British representative in the Carpathians. This is rendered necessary by the great preponderance of British shipping, and the total number of vessels which cleared from the Danube at Sulina in 1897 was 1324, with a tonnage
of 1,397,917, the proportion of British vessels (all steamers but four) was 544, of 855,477 tons, and those figures form approximately the proportion during recent years. The following statistics, conceivably stated, show the financial and commercial position of the country at the beginning of her commercial relations with Great Britain.

In 1895 the National Debt was £74,585,890, paying over £3,000,000 annual interest; revenue, £7,814,000; expenditure, £7,486,997. The permanent army comprises 60,000 officers and men. The total exports of all kinds were valued at £16,902,000; total value of imports, £13,516,000; total value of domestic manufactures, £3,118,500; total value of exports from Roumania to Turkey, £3,017,000; (in 1896, £1,366,593.

History and Political Rule. Tenure of an early Greek historian mention Thracian tribe, the Gete, from whom were descended the Dacians, a brave race who occupied the northern side of the Ister or Danube, and flourished as a free people down to about the end of the first century of our era. Before that time the Dacians had come into conflict with both Greeks and Romans, but in the year 101 A.D. the Emperor Trajan undertook the first of two expeditions against their king, Decebalus, which terminated in the complete subjugation of the country. Traces of the battle were still to be found in the military road constructed by Trajan along the banks of the Danube, including a commemorative tablet, and in the piers of a bridge across the river near Orsova. Pressed by the barbarian races who eventually compassed the downfall of the Roman empire, Dacia, which had been a constituted Roman colony, was evacuated by the Romans in the reign of Aurelian (about 274 A.D.), and for about a thousand years the banks of the Danube served as halting-places for the first-named wandering tribes. The most conspicuous were the Goths; the Huns under Attila; the Lombards under Alboin; the Bulgari, who afterwards settled on the plains south of the Danube and founded Bulgaria; the Ungri, a savage race who settled in Hungary; and the Walachia, from whom Wallachia has derived its name. For a considerable period both banks of the Danube were governed by the sovereigns of what is known as the Wallachio-Bulgarian dynasty, which was brought to a close by a Tartar invasion about the year 1250 A.D. A Roman invasion followed and the number of smaller states an independent realm in Wallachia, with its traditions of heroes and chiefs, Mircea the Old, Michael the Brave (whose memory is perpetuated by a beautiful equestrian statue at Bucharest), and others; whilst the neighbouring state of Moldavia had also its heroes in Stephen the Great, &c. These rulers for a long time resisted the Musulman advance, but were eventually reduced to vassalage by the victorious Turks, and were compelled to sign what are known as the 'Capitulations,' by which they were bound to the sultan. The first treaty with Wallachia known by that name was signed as far back as 1393; but that with Moldavia, which country was supported by the king of Poland, followed as late as 1512.

Although Wallachia and Moldavia thus became states tributary to the Porte, they retained sufficient independence to be in a sense autonomous; but in the course of time their princes, or voivodes as they were called, were Turkish nominees, whose tenure was determined by the fact that in the course of ninety years (from 1723 to 1812) the government of Wallachia passed through the hands of no less than forty of these rulers. They were mostly Greeks, known as Phanariotes or Fanariots (q.v.), who during their brief tenure of power practised the most scandalous extortions upon the people, in order to enrich themselves and remit the annual tribute to Constantinople. The great majority of those Fanariot voivodes either were assassinated or were disgraced through the intrigues of their rivals at the Sublime Porte; and some of them died by their own hand, too worn out by the misfortune or tenure of power for the support of Russia, which country was constantly at war with their suzerain.

The Muscovites began to make inroads into the Danubian principalities as early as the year 1700, under Peter the Great, and continued to invade them at intervals, especially in the reign of the Empress Anne in 1755 and in that of Catharine IV. in 1768. In the first instance the Czar Peter was invited to enter the states by the voivodes Brancovan of Wallachia and Cantemir of Moldavia, who desired to secure their independence under his protection; but no such inducement was afterwards requisite; and although the Russian invasions and occupations were always undertaken on the pretext of liberating the Christians from the Musulman yoke, the real motive was to advance step by step to Constantinople and to secure possession of the whole Balkan peninsula. At different times the Russians exercised absolute sway in the principalities, notably from 1795 to 1792 and from 1806 to 1812, when the princes under their protection deemed it expedient to pay the requisite tribute. This tributary state, the name. In 1848 they helped to suppress the national rising there, as they did in Hungary, but in 1853, before the Crimean war, their power began to wane. At the termination of that war they were compelled by the allied powers to cede Bessarabia to the principalities.

In the year 1859 both principalities elected Prince Cuza (born at Galatz, 1820) as their ruler, and he reigned in Roumania, as the united provinces were then called, until 1866, when he was deposed on account of his connexion with the Russian and Slavonic word. It was succeeded by Prince Charles of Hohenzollern. This revolution was mainly led by two able statesmen, Bratiano and Rosetti, who may be said to have been jointly the counterpart of the Italian Cavour, and who for many years enjoyed great popularity as the chief ministers of state. On the outbreak of the Russo-Turkish war in 1877 the Roumanians espoused the Russian cause. Prince Charles was actually appointed commander-in-chief of the allied armies, the Russian Cesarowitch serving under him. The event was the first redoubt, the Grivitsa, at Plevna, thereby enabling the Russians to reduce that stronghold and bring the war to a triumphant close. The conquerors, however, deprived their allies of part of their territory, Bessarabia, giving them in exchange the Dobruja, which they exacted from the Porte—an exchange laid down in the treaty of San Stefano, and subsequently confirmed by the Berlin Conference (June 1878), when Roumania was re-recognised as a completely independent power. The effect of this treaty however, has been unfortunate for Russia in two respects. It has caused a permanent estrangement between the Roumanians and their guardian allies, and the Dobruja has served as a barrier against Russian aggression in Bulgaria. In 1881 Prince Charles was invested with the kingly dignity with the acquiescence of the European Powers, and since that time, although there have been ministerial crises, and although the Russians have continued to exercise an interest on the part of Roumania, but from then on, in Bulgaria, the Roumanians have practically freed themselves from Russian as well as Turkish influence, and have taken their place amongst the independent nationalities of Europe.

The various conquerors who have at one time or another occupied Roumania have left their traces
in her language and customs. The social condition of the middle and upper classes bears traces of the libertinage of their barbarian conquerors of the Mussulman as well as of the Christian faith. The peasantry are a hardy and thrifty race, and in the highest circles of society the influence of Queen Carmen Sylva has been throughout beneficent. As her marriage left no heir, the succession to the throne passed to Prince Ferdinand of Holstein-Glottenhain (born in 1865), the nephew of the king.

Language and Literature.—Roumanian (or Walachian) is one of the Romance Languages (q.v.), a daughter of the Latin; but, though the language is unmistakably Romance in type, the vocabulary is mixed, the number of Latin roots being variously estimated at more or less than half of the total, the next greatest element being Slavonic words (amounting, according to some authorities, to even more than the Latin roots), with some hundreds of Turkish, Greek, and Albanian words. Most Roumanians speak what is practically the same language—the Daco-Roumanian—throughout the kingdom, in Transylvania, in the Banat, and other parts of Hungary, Bukowina, and Bessarabia. The Macedo-Roumanian, south of the Danube and amongst the Balkans and Pindus, is largely modified by Greek; and the Istro-Roumanian spoken by 2000 or 3000 in Istriot and Croatia, has been much Slavonised.

Roumanian literature may be said to date from the 17th century, though the first Roumanian book was a psalter, was printed in 1577. The chronicles of the 17th century are the earliest specimens of national literature; but Greek was long the language of the educated, and it is only since the beginning of the 19th century that there is a popular Roumanian literature, the most interesting part of it being the songs. Of these Alexandri (q.v.), himself the most noted of native Roumanian poets, made a full collection (1866). Other names are Alexandrescu, Eminescu, and Socherhansesc. There are German translations by Carmen Sylva (q.v.), Kotzebue, and others. Dora D'Istria (see GIHKA) wrote mainly in French. Among authorities on the language are Hasdeu, Miklosich, Gaster, and Titkin, and there are histories of the literature by Ciprian, Bensaulian, Gaster, Popidu, and Philippe (1894). The great dictionaries are those of Codrescu (1875), Laurian and Massinu, Dictionarul Limbez Romanie (2 vols., 1876-79), and Hasdeu, Etymologicum Magnum Romanie (parts i and ii, 1886-92); and there are standard Chrestomathies by Gaster (new ed. 1891) and Pompilius. There are German translations of Roumanian folktales, poems, and songs by Albert Schott (1845), Wite Krenzirtz (1882-83), and Rudow (1888).

See works on Roumania in Roumanian by Aurelian, Teza Nostra (1888); in French by Bezeau and Mathereal (1878), Harsenberg (1886), and Bley (1896); in German by Henke (1877), Bergner (1887), and Benger (1896); and in English by the present writer (1882) and Mrs Walker (1888); the Histories by Laurian (1873), Hasdeu (1874), Cogolinovano, Schinkai, Tocilesuc, Vaceescu, Durmuszaki, Stoudza (1886), &c.; Lavelle, The Balkan Peninsula (trans. 1887), W. Miller, The Balkans in the 'Story of the Nations' series (1896), and other books named at Balkan Peninsula; the Roumanian official statistics; and a long series of English consular reports and Board of Trade returns.

**Roumanille, Joseph** (1818-91), born at St Remy (Bouches-du-Rhone), was successively teacher, printer's reader, and bookseller, and obtained the fame of being the greatest of modern Provençal poets, next after Mistral. He was one of the founders of the association of the Félibres (see PROVENCAL LANGUAGE AND LITERATURE).

**Roumilia** (Turk. Rum Hî, 'land of the Romans'—the inhabitants of the Western Roman empire, or Byzantine Greeks, being known to the Turks as 'Romans'), a name which once applied generally to the whole of ancient Thrace and part of Macedonia. The province aptly enough called Eastern Roumilia is now incorporated with Bulgaria (q.v.). In central Asia Rum or Rumi means the peoples of western Asia; but the Sultan of Turkey is Rum-Padschah. In Turkey itself Rum means now usually the Greek nation and the Greek Church.
